Table 2

RDC Inclusion Criteria for Major Depressive Disorders: The Presence of a-d Are Required

YES	NO	(a)	Dysphoric mood or pervasive loss of interest or pleasure. The period(s) of dysphoric mood is/are characterized by such symptoms as "depressed, sad, blue, hopeless, down in the dumps, don't care anymore or irritable."
YES	NO	(b)	At least *five* of the following symptoms are necessary to have occurred as part of the episode for "definite" depression and *four* for "probably" depression.
YES	NO		(1) Poor appetite or weight loss or increased appetite or weight gain (change of 1 pound a week of 10 pounds a year with no dieting).
YES	NO		(2) Sleep difficulty or sleeping too much.
YES	NO		(3) Loss of energy, fatigability, or tiredness.
YES	NO		(4) Psychomotor agitation or retardation (but not mere subjective feeling of restlessness or being slowed down
YES	NO		(5) Loss of interest or pleasure in usual activities, including social contact or sex (not included or limited to a period when delusional or hallucinating). (The loss may or may not be pervasive).
YES	NO		(6) Feelings of self-reproach or inappropriate guilt (either may be delusional).
YES	NO		(7) Complaints or evidence of diminished ability to think or concentrate, such as slowed thinking, or indecisiveness (do not include if associated with marked formal thought disorder).
YES	NO		(8) Recurrent thoughts of death or suicide, or any suicidal behavior.
YES	NO	(c)	Duration of dysphoric features at least 1 week beginning with the first noticeable change in the subject's usual condition ("definite" means lasted more than 2 weeks, "probably" if 1 to 2 weeks).
YES	NO	·(d)	Sought or was referred for help from someone during the dysphoric period, took medication, or had impairment in functioning with the family, at home, at school, or socially.

The Phobic Disorders are subdivided into agoraphobia (with or without panic attacks), Simple Phobia, and Social Phobia.

DSM-III also recognizes and defines a number of depressive disorders based on such considerations as severity, and whether or not there has been a history of manic or hypomanic features (see DSM-III, pp. 220-224). Since a number of large-scale collaborative studies are employing the Research Diagnostic Criteria (RDC) for Major Depressive Disorder (Feighner et al. 1972), these inclusion criteria are summarized in Table 2.

In practice, many research studies focused on the evaluation of pharmacotherapy and/or psychotherapy for the treatment of nonpsychotic, nonbipolar, depressed outpatients, as well as studies on nonpsychotic outpatients. These studies have employed rating scales and checklists to help define their anxious and depressed cohorts (e.g., Lipman et al. 1981). In this regard, two relatively simple physician rating scales have been developed by Raskin and by Covi (Lipman et al. 1981). Each scale employs three subscales which tap the dimensions of verbal report, behavior, and somatic symptoms. Typically, a minimal severity sum of 7, 8, or 9 has been employed on thes scales (range from 0 to 15) to select patients with sufficient severity of anxiety and/or depresssion to qualify the patient for inclusion in treatment outcome studies with antidepressant and/or antianxiety medications. The Covi Anxiety Scale is presented in Table 3 and the Raskin Depresssion Scale is shown in Table 4.

Table 3

not at all	somewhat	moderately	considerably	very much	Anxiety Scale (Covi)
1	2	3	4	5	**Verbal Report:** Feels nervous, shaky, jittery, jumpy, suddenly scared for no reason; fearful, apprehensive, tense or keyed up; has to avoid certain things, places, activities because of getting frightened; finds it hard to keep mind on task.
1	2	3	4	5	**Behavior:** Appears frightened, shaking, restless, apprehensive, jumpy, jittery.
1	2	3	4	5	**Somatic Symptoms of Anxiety:** Unjustified sweating, trembling; heart pounding or racing; trouble getting breath; hot or cold spells; restless sleep; going unjustifiably more frequently to bathroom; discomfort at pit of stomach; lump in throat.

Table 4

not at all	somewhat	moderately	considerably	very much	Depression Scale (Raskin)
1	2	3	4	5	**Verbal Report:** Feels blue; talks of feeling helpless, or worthless; complains of loss of interest; may wish to be dead; reports of crying spells.
1	2	3	4	5	**Behavior:** Looks sad, cries easily, speaks in a sad voice; appears slowed down; lacking energy.
1	2	3	4	5	**Secondary Symptoms of Depression:** Insomnia or hypersomnia; G.I. complaints; dry mouth; history of recent suicide attempt; lack of appetite; difficulty in concentrating or remembering.

In addition to these very simple scales, the study utilized other physician (therapist) rating scales, namely, the American College of Neuropsychopharmacology (ACNP) Checklist for Anxiety and Depression (Wittenborn 1977); and the Hamilton Anxiety and the Hamilton Depression Scales (ECDEU Assessment Manual 1976). Since the ACNP Anxiety and Depression checklists are not generally available, and since these scales were specifically developed as guidelines for the Food and Drug Administration (FDA) in evaluating the adequacy of subject selection for trials of antianxiety and antidepressant medications, respectively, they are presented here in Tables 5 and 6.

Table 5

ACNP Depression Checklist

YES	NO	Main Symptoms
____	____	Dysphoric Mood (depressed, sad, despondent, hopeless, down in the dumps, discouraged).
		Associated Symptoms
____	____	Poor appetite and weight loss (2 lbs per week or 10 lbs per year, if not dieting).
____	____	Sleep difficulty (insomnia or hypersomnia)
____	____	Loss of energy (fatigability, tiredness)
____	____	Agitation or retardation
____	____	Recent loss of interest in usual activities and decreased libido
____	____	Self-reproach or guilt feelings
____	____	Complaints of (or actually diminished) thinking and concentration (slow thinking, mixed-up thoughts)
____	____	Recurrent thoughts of death or suicide, wish to be dead
____	____	Anhedonia (inability to experience pleasure)
____	____	Bodily complaints.

It should be noted that the ACNP Anxiety guidelines require "moderate" levels, or higher, on the first two manifestations (feeling nervous, jittery, jumpy; feeling fearful, apprehensive, anxious, panicky) and at least three other symptoms and signs of anxiety. The syndrome definition of depression requires depressed mood (characterized by "sad, low, blue, despondent, hopeless, gloomy") plus four or five of the associated symptoms. It is interesting to note that anxiety and tension (Item 14) and agitation (Item 6) which are included as symptoms of the depressive syndrome are also contained as part of the symptomatology of the anxiety syndrome. Similar overlaps of symptomatology, i.e., sleep disturbance, are also present on the Hamilton Anxiety and Hamilton Depression Scales. The members of the ACNP task force that drafted these guidelines were aware of the issues around the separation and overlap among patients with anxiety and/or depression.

In this regard, they indicate "the coexistence of anxiety and depression...also presents a special problem. Although the two states frequently occur together in varying degrees, most patients can be classified as primarily anxious or primarily depressed." (p. 220)

Table 6

ACNP Anxiety Checklist

YES	NO	Main Symptoms
____	____	Feeling nervous, jittery, jumpy
____	____	Feeling fearful, apprehensive, anxious, panicky
		Associated Symptoms
____	____	Fears of fainting, screaming, losing control, crowds, places, disaster, death
____	____	Avoiding certain places, things or activities because of fear
____	____	Feeling tense or keyed up
		Muscular or Motor Phenomena
____	____	Tense Muscles, aches
____	____	Trembling, shaking
____	____	Restlessness, fidgeting
		Autonomic Phenomena
____	____	Heart beating fast or pounding; chest pain
____	____	Trouble catching breath, air hunger, smothering, lump in throat, choking
____	____	Sweating, especially armpits, palms, soles of feet
____	____	Cold clammy hands
____	____	Dry mouth
____	____	Dizziness, faintness, lightheadedness, weakness
____	____	Tingling feelings in hands or feet
____	____	Stomach "gas," nausea, upset stomach

Table 7

HSCL Anxiety Cluster

Items	R11
Nervousness or shakiness inside	
Heart pounding or racing	
Sweating	
Suddenly scared for no reason	
Trouble getting your breath	
Trembling	
Hot or cold spells	
Feeling tense or keyed up	
Faintness or dizziness	
Feeling fearful	
A lump in your throat	0.80

Table 8

HSCL Depression Cluster

Items	R11
Feeling low in energy or slowed down	
Thoughts of ending your life	
Poor appetite	
Feeling blue	
Feeling no interest in things	
Feeling hopeless about the future	
Blaming yourself for things	
Loss of sexual interest or pleasure	
Crying easily	
Feeling lonely	
Constipation	0.81

In addition to the use of therapist rating scal to help select anxious or depressed patients, man research teams also make use of patient sel ratings. Among the most frequently used of th patient self-rating scales is the Hopkins Sympto Checklist (Lipman et al. 1979). Normative dat are available for the 58-item version of this Scal (Derogatis et al. 1974) and many investigato have required that patients rate themselves at level of distress on the Anxiety and/or Depressio Clusters at least two standard deviations highe than the means of the normative sample, i.e., score of 1.65 on the Anxiety Cluster and a score o 1.70 on the Depression Cluster. The items tha define these clusters are presented in Tables 7 an 8.

The clusters themselves reflect the consens among experienced clinicians that the items subsumed in each cluster reflect either anxiety o depression (Lipman et al. 1968). In this regard there was at least 75 percent agreement amon each of 20 experienced clinicians that the item given in Tables 7 and 8 reflected either anxiety o depression. The Hopkins Symptom Checkli (HSCL) was employed by Prusoff and Klerma (1974) in a study of anxious and depressed outpatients who participated in trials of antianxiety an antidepressant medications, respectively. Th depressed sample consisted of patients who wer treated in either New Haven or Baltimore; th anxious patients all had participated in controlle psychotropic drug trials at the Johns Hopkin University and were selected from a much large data file to match the depressed sample on age, sex, and social class. A discriminant functio analysis was employed to determine whether o not the five factors of the HSCL would reliably differentiate the anxious and depressed samples. While the 66 percent discrimination of diagnostic groups was reliably better than would by expected by chance, these data suggest considerable overlap among diagnostic groups. The main discrimination in this study was derived from the Somatization factor of the HSCL which was higher in the anxious sample despite the generally higher level of distress in the depressed group. The use of the individual items of the HSCL did not add much to the separation of diagnostic groups. In an earlier less systematic study by Kellner et al. (1972), somatic symptoms were also found to occur more with anxiety than with depression.

In a very large sample collaborative study supported by the Pharmacologic and Somatic Treatments Research Branch of the National Institute of Mental Health, Johns Hopkins University (L. Covi, Principal Investigator), Boston University (D. McNair, Principal Investigator), and the University of Pennsylvania (K. Rickels, Principal Investigator), the issue of the distinctiveness between anxiety states and depressed disorders was addressed within the context of a placebo-controlled drug trial which employed tranquilizers and tricyclic antidepressants. The preliminary results of this study were reported at the December 1980 meeting of the ACNP, and four papers were subsequently published in the July 1981 issue of the *Psychopharmacology Bulletin* (Covi et al. 1981; Downing et al. 1981; Kahn et al. 1981; Lipman et al. 1981).

In order for outpatients to be selected for this study, they must have self-rated themselves as significantly anxious and/or depressed on the corresponding HSCL clusters of Anxiety (1.65 or higher) or Depression (1.70 or higher) and must also have been rated at least "moderately" anxious and/or depressed by the intake psychiatrist on the Raskin and/or Covi screens (8 or higher). Additionally, the patient must have been anxious and/or depressed for at least 2-3 weeks prior to intake and must not have ever been schizophrenic, alcoholic- or drug-addicted, mentally retarded, organically impaired, sociopathic, or bipolar.

In addition to these main inclusion and exclusion criteria, patients were also classified by DSM-II criteria and according to categories of anxiety and/or depression as proposed by such investigators as Klein and Davis (1969) and Overall et al. (1966). Since the primary purpose of the study was to assess the clinical response of anxious and depressed outpatients to commonly employed anxiolytics and antidepressants, the reliability with which these groups can be identified and the distinctiveness of the groups in terms of diagnosis and presenting symptomatology is critical. In order to address these issues, each patient was classified as primarily anxious or primarily depressed on three separate occasions: 1) by an intake psychiatrist; 2) 1 week later by the psychiatrist who treated the patient; and 3) by this same treating psychiatrist after the patient had completed a 2-week placebo washout period. The agreement in diagnostic assignments was reflected by Kappas of .62 between the intake and treating psychiatrists and .73 between the same psychiatrists before and after the 2-week placebo period. Eighty-seven percent of the patients classified as depressed at intake and 75 percent of those classified as anxious at intake were again so classified by an independent psychiatrist 1 week later. These respective proportions were 90 and 83 percent in the ratings of the same psychiatrists which were made 2 weeks apart. Clearly, then, the assignment of anxious and depressed patients to diagnostic groups has been made with reasonable reliability.

In addition to the scales already mentioned, the study also employed the Hamilton Anxiety and Hamilton Depression Scales and the ACNP Checklist for Anxiety and for Depression. A typical psychiatric and family history was also collected on each patient, and DSM-II diagnoses were made. Not surprisingly, 93 percent of the patients judged to be primarily anxious received the diagnosis of Anxiety Neurosis, whereas about 88 percent of those patients classified as primarily depressed were given the diagnosis of Depressive Neurosis. Other diagnostic details are given in Downing et al. (1981).

Although there was considerable overlap in levels of anxiety and depression between the 424 patients classified as primarily depressed and the 240 patients classified as primarily anxious, each scale reliably differentiated between the diagnostic groups in the expected direction. On the Covi Anxiety Scale the mean for the anxious group (10.4) was significantly higher ($p < .001$) than the mean (8.31) for the depressed group. On the Raskin Depression Scale the mean for the depressed (10.4) sample was reliably higher

($p<.001$) than the mean for the anxious (7.65) sample. Statistically significant differences of roughly comparable magnitude were also found when the mean scores of the anxious and depressed groups were contrasted on the ACNP checklists of Anxiety and Depression. Similar results were also observed for the Hamilton Anxiety and the Hamilton Depression Scales. The results for the ACNP Anxiety and Depression Checklist are shown in Figure 1.

ANXIETY AND DEPRESSION — FDA GUIDELINE CHECKLIST
(Anxiety: N=226; Depression: N=404)

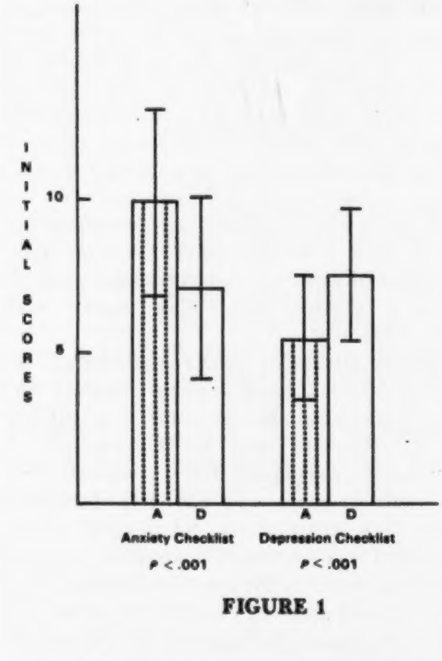

FIGURE 1

The results obtained on the HSCL agree with the prior findings of Downing and Rickels (1974), "...anxiety and depression dominated the symptom profiles of all patients, but in anxiety study patients, anxiety was the more severe...while in depression study patients, depression was the more severe." In the present study, mean cluster scores for the anxious group were significantly higher for Anxiety ($p<.025$) and Somatization ($p<.025$) whereas in the depressed group, mean scores were higher on the Depression ($p<.001$), Obsessive-Compulsive ($p<.001$), and Anger-Hostility ($p<.025$) clusters. In the depressed group, the ranking of symptom distress from hi to low was Depression, Obsessive-Compulsiv Anxiety, Somatization, and Anger-Hostility. T corresponding ranking in the anxious group wa Anxiety, Depression, Obsessive-Compulsiv Somatization, and Anger-Hostility. A somewh more fine-grained breakdown of symptom profil for the nine apriori factor scores postulated to b contained in the 90-item version of the HSCL i presented in Figure 2.

As expected, the anxious group self-ra themselves higher than the depressed group o items contained in the Phobic-Anxiety clust ($p<.001$). When the relative rankings of the ni clusters of the HSCL are compared in the anxio and depressed groups, it is of interest that th rank-order correlation (RHO) of .87 ($p<.01$) i quite high. This indicates that, despite th statistically significant differences in level o distress on these dimensions of symptomatolog the pattern or profile of distress is quite similar i primarily anxious and primarily depressed pa tients. Indeed, were it not for the differences be tween groups in the relative rank ordering of anx iety (1.5 in the anxious group vs. 6 in the depres ed group) and depression (4 in the anxious vs. 1 i the depressed), the correlation in ranks would b almost perfect.

To further pursue the question of qualitativ differences in symptomatology between th primarily anxious and primarily depresse groups, the RHO among the 17 items comprisin the depression cluster and the RHO among the 1 items comprising the anxiety cluster wa calculated. For the depressed vs. anxious grou on the Depression cluster the rho was .95 ($p<.0$ while the RHO was .88 ($p<.05$) between group on the Anxiety cluster. In fact, the RHO of .7 was significant across groups on the 6-ite Phobic-Anxiety cluster. Clearly, then, there i both a remarkable similarity of symptom profile across the various domains of outpatient distres as well as within the more specific areas o depressive and anxious symptomatology. I should also be made clear to the reader that th symptom levels of nonpatient groups ar remarkably low and very significantly differen statistically than the observed levels in our anx ious and depressed groups (Derogatis et al. 1974)

In a further step to explore differences in symp tomatology between anxious and depresse samples, the specific symptoms which were rate

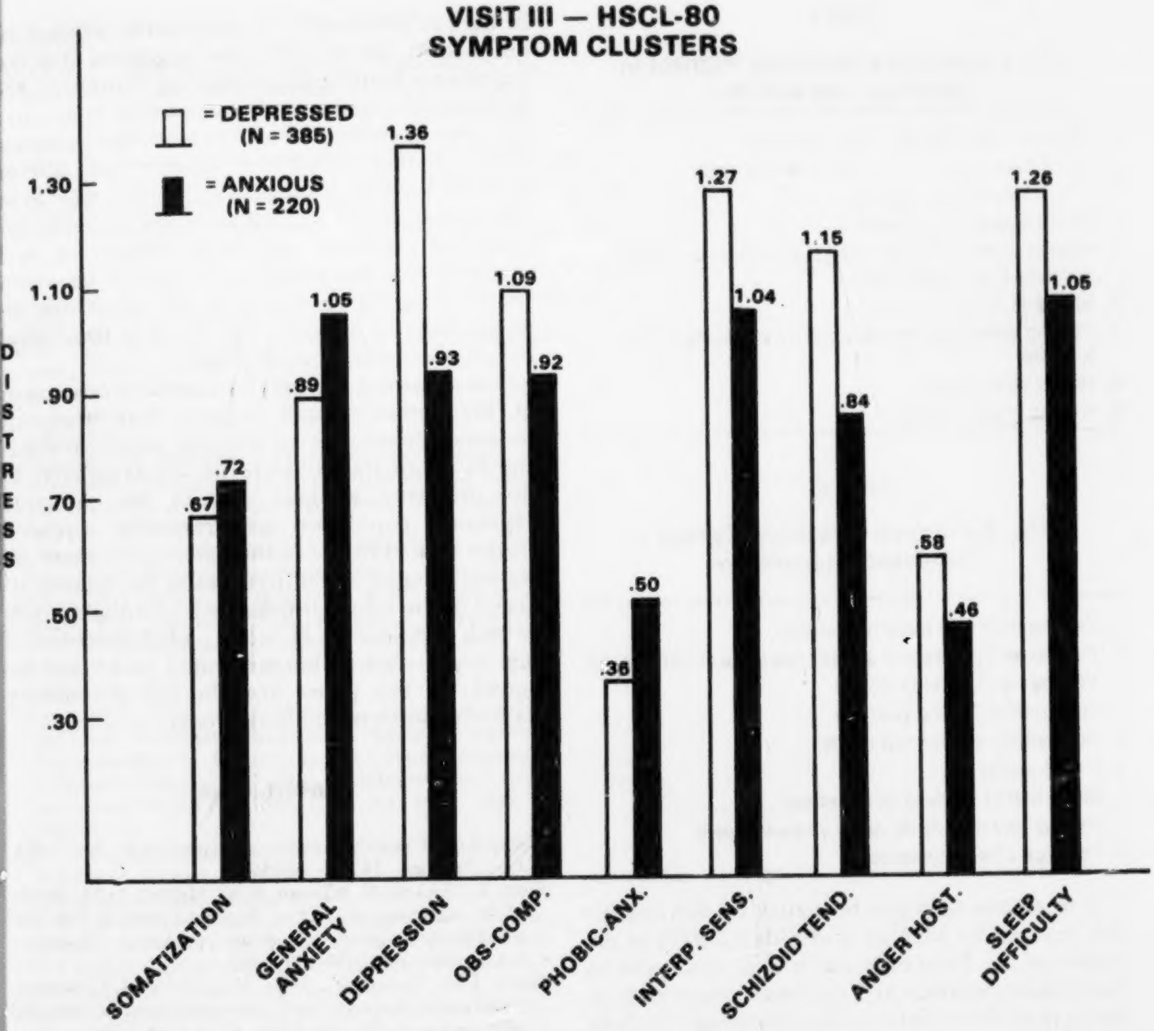

FIGURE 2

higher by anxious than depressed patients are presented in Table 9. The items comprising this table are clinically very meaningful and, in DSM-III terminology, they are associated with the diagnosis of Agoraphobia with Panic Attacks.

A similar analysis of items rated higher by depressed than anxious patients was cut off after nine items, since the depressed sample was relatively more distressed on all the items of the HSCL-80 with the exception of those items listed in Table 9. The nine items rated highest by the depressed group are presented in Table 10. First, it is clear that all the items in Table 10 are reflective of depression and, second, that the depression has an endogenous quality. Again, these are a very meaningful cluster of symptoms.

Table 9

HSCL Symptoms Relatively Highest in Anxious Outpatients

1. Feeling afraid you will faint in public
2. Numbness or tingling in parts of your body
3. Heart pounding or racing
4. Trouble getting your breath
5. Having to avoid certain things, places, or activities because they frighten you
6. Spells of terror or panic
7. Feeling uneasy in crowds such as shopping or at a movie
8. Hot or cold spells
9. A lump in your throat

Table 10

HSCL Symptoms Relatively Highest in Depressed Outpatients

1. Feeling hopeless about the future
2. Feeling all the pleasure and joy has gone out of your life
3. Feeling no interest in things
4. Thoughts of ending your life
5. Not getting any fun out of life
6. Crying easily
7. Sleep that is restless or disturbed
8. Feeling you may never enjoy yourself again
9. Feelings of worthlessness

One cannot help but be struck by the conclusion reached by McNair and Fisher (1978) in the review of the Newcastle study that attempted to discriminate anxious and depressed inpatients on the basis of their initial symptomatology. McNair and Fisher indicated: "several single symptoms correctly classified the sample...a little reflection on these symptoms suggests that panic anxiety versus endogenous depression or agoraphobia versus endogenous depression might more precisely name the factor."

As was pointed out early in this paper, neither anxiety disorders nor depressive disorders are unitary illnesses, and it would seem easier to differentiate certain types of anxiety disorders from certain types of depressive disorders. Again, these distinctions seem to be quantitative, rather than qualitative.

It should be noted that other domains than symptomatology as assessed by rating scales can be used to differentiate anxiety and depression. I this regard, Beck (1971) has suggested that th cognitive schemata characterizing depression di fer from the cognitive schemata found in anxiet He stresses themes of loss as underlying depre sion, whereas themes of danger are said underlie anxiety. Biological differences such as i blood flow and in cortisol secretion probably di ferentiate between primarily depressed an primarily anxious patients. Psychiatric history i terms of age of onset and family psychiatric il nesses are also relevant. Finally, it is also critic to consider treatment response.

The results of the collaborative study discusse in the present paper suggest that treatme response differences to tricyclic antidepressan and to minor tranquilizers are not as different i the primarily anxious and in the primaril depressed population as previously suppose (Kahn et al. 1981). On the other hand, there ar clinically important differences in the relative ef ficacy of the minor tranquilizer chlordiazepoxid in both populations. However, a full discussion o this more subtle difference would go beyond th bounds of this paper and the still preliminar nature of some of the data analytic results.

Are There Anticompulsive or Antiphobic Drugs? Review of the Evidence

Isaac Marks, M.D.[1]

This paper summarizes a more detailed review of controlled studies of antidepressants for phobic and obsesssive-compulsive disorders (Marks et al. in press). Despite their impressive differences in phenomenology, obsessive-compulsive and phobic disorders are dealt with together because they share common features of avoidance and accompanying discomfort as well as frequently coexisting dysphoria* (anxious-depressed mood), and both respond similarly to antidepressants and to behavioral treatments.

A literature search found 12 controlled studies of antidepressants for predominantly phobic and 4 for predominantly obsessive-compulsive problems which satisfied the criterion of a minimum of 8 patients who completed drug treatment (Ananth 1980; Gittelman-Klein & Klein 1971; Insel et al. 1982; Lipsedge et al. 1973; Marks et al. 1980, in press; Mavissakalian & Michelson 1982; McNair & Kahn 1981; Mountjoy et al. 1977; Pecknold et al.,1980; Sheehan et al. 1980; Solyom et al. 1981; Thorén et al. 1980; Tyrer et al. 1973; Zitrin et al. 1978, 1982). All reported drug dosages in the moderate-high range usually considered adequate for depressive illnesses. All concerned mainly female, adult populations aged 20-60 with problems which have usually been there from 1-10 years or more. Most concerned outpatients, though three involved inpatients who were obsessive-compulsive (Insel et al., 1982; Marks et al. 1980; Thorén et al. 1980). The phobics were largely agora- and social with panic attacks and anxiety-depression (dysphoria). The latter concerns symptoms, not diagnosis, as most studies excluded patients who had either severe depression as a symptom or depresssive illness as a diagnosis. One study concerned school phobics (Gittelman-Klein & Klein 1971) and another included a group of simple phobics (Zitrin et al. 1978).

Anxiety-Depression and Outcome

One predictor of drug effect seems to be the *starting level of dysphoria,* drug effects generally being absent where this is low. Lack of common measures across studies complicates the task, but five paired comparisons were possible of studies with common measures (Insel et al. 1982; Marks et al. 1981, in press; Mavissakalian & Michelson 1982; Sheehan et al. 1980; Solyom et al. 1981; Zitrin et al. 1980). In four of the five comparisons, the studies reporting drug effects had significantly higher starting levels of dysphoria than those finding no drug effects. The exception is Zitrin et al.(1980), whose patients had as low a rating as those of Marks et al. (1982) on the single depressive item on which they could be compared (Klein, personal communication).

Table 1 shows a detailed comparison between Sheehan et al. (1980) and Marks et al. (1982)—the latter's London sample tended to be *more* agoraphobic as well as *less* dysphoric than the former's Boston sample. This indicates that London and Boston patients did not differentially respond high or low to questions as a whole (no difference in response set), but rather to certain types of symptoms (they differed in the kinds of symptoms they emphasized. These comparisons highlight the difficulty in obtaining closely comparable populations across centers merely by utilizing diagnostic categories alone, and illustrate the additional need to report initial phenomenological features on standard measures.

---

[1] Institute of Psychiatry, London SE5 8AF, England. (This study was done while Dr. Marks was at the Center for Advanced Study in the Behavioral Sciences, Stanford, California.)

*"Dysphoria" here denotes symptoms of anxiety-depression, not the diagnosis of the syndromes of generalized anxiety state, dysthymia, or depressive illness. Anxiety and depression overlap so much both as symptoms and as syndromes that they are often indistinguishable (reviewed by Marks 1981b).

Table 1

Comparison of Initial Scores of Agoraphobics of Marks et al.*1982 (M) and Sheehan et al. 1980 (S)

		a None or Mild (Percent)	b Moderate (Percent)	c Extreme (Percent)
Depression				
(S) Feeling blue	$N = 57$	28	40	32[b]
(M) Feeling miserable or depressed	$N = 45$	55	32	13[b]
Agoraphobia				
(S) Phobia: Going out of house alone	$N = 57$	25	19	56[c]
(M) Phobia: Going out alone far from home	$N = 45$	16	11	73[c]

[a] none or mild = score 0, 1, or 2; moderate = score 3, 4, 5; extreme = score 6, 7, or 8.
[b] X^2 $p < .01$ (a vs. b vs. c)
[c] X^2 $p < .07$ (a + b vs. c)

A coarser way of judging the effect of dysphoria is by grouping the studies according to initial levels of dysphoria, regardless of the particular measure used (Table 2). Levels are based on scores reported elsewhere (Marks, in press-b). The lower right sector of Table 2 shows that in those four studies where a drug effect was absent the starting level of dysphoria was especially low. The placing of the study of Zitrin et al. (1980) is unclear, because on the Brief Psychiatric Rating Scale (BPRS) the sample would be rated as mild-moderately dysphoric, yet on another item (Table 1, and Klein, personal communication) it would be mild-absent.

Table 2

Outcome Versus Initial Depression Score (Controlled Studies of Phobics and Obsessive-Compulsives)

	Initial Mean Depression Score		
Drug Effect	Moderate	Moderate-Mild	Mild-Absent
Present	Sheehan et al. (1980)	Tyrer et al. (1973)	?Zitrin et al. (1980)

Initial depression scores not reported:
Drug effect present: Lipsedge et al. (1973)
Zitrin et al. (1978)
Drug effect absent: Mountjoy & Roth (1974)

Within three of the studies on obsessive-compulsives, direct comparison was possible between patients with the highest and the lowest levels of initial dysphoria. Two of these comparisons showed that the effect of clomipramine was exclusively attributable to those patients with the highest levels of dysphoria at the start, and was absent in those with initially low levels. Table 3 displays the data for clomipramine patients taken from Table 1 of Thorén et al. (1980).** Three of the eight clomipramine patients had secondary depression and these three responded in the open part of the study, while only one of the five without secondary depression was a drug responder (these were also the five patients with the highest plasma levels of clomipramine—Åsberg, personal communication). During the 5-week controlled phase of the study, pa-

tients with initial depression subsequently improved significantly less than those without depression (analysis of variance).

The Figure shows a similar analysis for th ritualizers of Marks et al. (1980); here the tw samples represented the highest and lowest qua tiles for depression on the Hamilton an Wakefield scales. Again, the clomipramine eff occurred exclusively in those with the highest star ting levels of depression. Further analysis cf the patients (Mawson et al. 1982) found that a singl 0-8 scale for initial free-floating *anxiety* was almo as good a predictor of clomipramine effect as wa depression, which is not surprising given their in tercorrelation of .70, but suggests that we shoul speak of dysphoria rather than depression.

A third comparison had discordant finding Insel et al. (1982, personal communication) com pared outcomes of his obsessive-compulsives wit the highest and lowest initial depression scale and found that both subsamples retained th superiority of clomipramine over clorgyline.

Among phobics, McNair and Kahn (198 found that imipramine had no significant drug ef fect on agoraphobia overall; a significan agoraphobia × depression interaction indicate

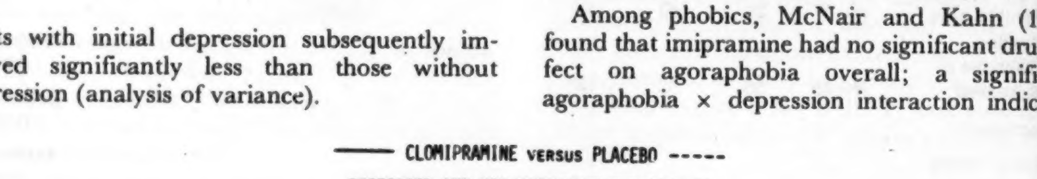

FIGURE. Outcome of ritualizers with clomipramine: Initially high vs. initially low depression (from Marks et al. 1980).

that imipramine reduced agoraphobia only when it was accompanied by depression. Imipramine did produce a significant reduction in depression and also in panics independently of depression.

Zitrin et al. (1980) found a negative correlation between starting level of depression and several measures of outcome, but did not compare outcomes of those with the highest and lowest starting levels, which might have detected effects obscured by their many patients in the middle starting level. The potential importance of this point is testified by the obvious relationship between initial depression and outcome in the ritualizers of Marks et al. (1980) when the top and bottom quartiles were compared, but the virtual disappearance of this relationship when it was sought for in the entire sample (Raskin, personal communication). Sheehan et al. (1980) found no relationship between five vegetative signs of endogenous depressive illness and outcome. Working with their data, this author could also find no relationship between outcomes contrasted in patients with the highest and the lowest levels of initial depression. However, even those with the lowest levels had fairly high starting levels (only two had Zung scores below 55). Table 2 suggests that there may be a threshold of moderate dysphoria below which a drug effect is unlikely, and the Boston sample had too few cases without dysphoria to test this hypothesis

Of the twelve studies in adult phobics (Lipsedge et al. 1973; Marks et al., 1980, in press; Mavissakalian & Michelson 1982; McNair & Kahn 1981; Mountjoy et al. 1977; Pecknold et al. 1980; Sheehan et al. 1980; Solyom et al. 1981; Tyrer et al. 1973; Zitrin et al. 1978, 1980), five found no drug effect on phobias (Lipsedge et al. 1973; Marks et al., in press; McNair & Kahn 1981; Mountjoy et al. 1977; Solyom et al. 1981). Of these five, two had patients with low initial levels of dysphoria (Marks et al. in press; Solyom et al. 1981), one found an antidepressant and antipanic but no antiphobia effect (McNair & Kahn 1981), and two did not report initial depression levels (Lipsedge et al. 1973; Mountjoy et al. 1977). The predominantly agoraphobic sample of Mountjoy et al. (1977) did not improve significantly on agoraphobia or on depression, only on a social phobia scale; all these patients had, in addition to phenelzine, a daily dose of 15 mg diapezam and 10 mg nitrazepam, which confounds interpretation. In the agoraphobics of Lipsedge et al. (1973), iproniazid had a significant effect on phobic anxiety but not on phobic avoidance.

A report which has been omitted because it dealt with patients who had a diagnosis of primary depression of at least 4 weeks' duration, often with additional phobic symptoms, is that of Nies and Robinson (1981). These phobias accompanying depression responded to either phenelzine, 60 mg/day (but not 30 mg), or to amitriptyline, 150 mg/day.

Antidepressants are Broadly Patholytic, While Exposure is More Specifically Antiphobic and Anticompulsive

The patterns of antidepressant drug effects among different outcome measures are of considerable interest. In general, studies which found a significant drug effect for phobias or obsessive-compulsive phenomena also found a significant effect for depression (Ananth 1980; Insel et al. 1982; Marks et al. 1980; Mavissakalian & Michelson 1982; Pecknold et al. 1980; Sheehan et al. 1980). Exceptions are Zitrin et al. (1980) and Tyrer et al. (1973), where drug effect was present for phobias but not for depression and, in the case of Tyrer et al., not for panic either. It is relevant here that in anxiety disorders, too, imipramine was more effective than chlordiazepoxide or placebo in reducing depression as well as anxiety (Kahn et al. 1981).

When present in these syndromes, the drug-effect is not restricted to phobias, rituals, and anxiety-depression, but seems more general. In the few studies which report measures across a broad spectrum of different symptoms, antidepressant drugs seem to improve most measures in a pattern of *general patholysis*. As an example, Sheehan et al. (1980) found that imipramine and phenelzine patients improved significantly on every measure, regardless of whether it concerned phobias, anxiety, depression, hostility, interpersonal sensitivity, somatic, obsessive-compulsive or other scores. Marks et al. (1980) found the same general patholysis for rituals, depression, anxiety, and social adjustment (*see* their Table 3 and their Figures 2A and 2B). Similarly, McNair and Kahn (1981) found an imipramine effect across a variety of problems such as panic, depression, and anger, though not for phobias (Table 4, modified from their Table 5). We do not yet know whether initial dysphoria is a better predictor of drug effect than is initial panic, anger, or hostility. Level of initial rituals or phobias has not been a good predictor where it has been examined.

Table 4

General Patholytic Effect of Imipramine in Agoraphobics Efficacy Summary for Completers at Week 8 (from McNair & Kahn 1981)

Global improvement	–	–	.05

.05, .01, etc. = Significant on ANCOVA
– = Not significant

Given the general patholytic effect of antidepressant drugs on several aspects of distress like panic, free-floating anxiety, and depression, among others, all of which intercorrelate highly to the order of 0.60 or more, it might be misleading to concentrate on panic attacks as the focus of action, as some authors do (Sheehan et al. 1980; Zitrin et al. 1978, 1980). Undoubtedly imipramine can block panic attacks, but it also blocks a lot of other cohering pathological features simultaneously. It is illogical to accept any one of those features as primary unless and until detailed analysis has shown that change in that feature precedes change in the other aspects. This has not yet been done. Tyrer et al. (1973) found no improvement in panics despite improvement in phobias; ratings concerned symptoms over the previous 3 days. Zitrin et al. (1980) are the only ones to actually report measures of panic which improved along with phobias, and did not demonstrate that panic improves before phobias, which sequence needs to be demonstrated if panic is to be regarded as the critical issue.

There is no reason to assume primacy of panic in agoraphobia. Panics are one of several manifestations of disturbed *mood*, others being free-floating background anxiety and depression, all of which tend to occur together. It is wise to heed the caution of McNair and Kahn (1981, pp. 77-78) that their "findings are not entirely congruent with Klein's views that relief of the agoraphobic component by imipramine is also independent of depression or that imipramine is ineffective for anticipatory anxiety. All of this underlines the need for greater knowledge of the role of depression, both secondary and primary, in the development and treatment of the panic-phobic syndrome."

It is of great interest to know why panics are so frequent in agoraphobia and in generalized anxiety disorder and unusual in obsessive-compulsive neurosis. A further issue is what differentiates anxiety disorders without agoraphobia from agoraphobic anxiety disorders. The question also arises why mood disturbance is so commonly associated with agoraphobia and obsessive-compulsive disorder.

The Diagnostic and Statistical Manual-III (DSM-III) subdivisions of dysthymic disorder, panic disorder, generalized anxiety disorder, and agoraphobia with and without panic attacks are not yet firmly based on hard scientific data showing that they have therapeutic or prognostic import. Symptoms of anxiety-depression (dysphoria) are a frequent feature not only in all these and in obsessive-compulsive disorder but also in many physical disorders, and are also the most common complaint in primary care populations across the globe. In one community survey "psychic distress," i.e., dysphoria, was present in 67 percent of agoraphobics (Balter, personal communication). The level of dysphoria may vary considerably among samples and partly accounts for differences in drug effects. Dysphoria from varied causes may be as responsive to antidepressants as is inflammation of diverse origins to aspirin, in both instances as long as the drug is given. We need to distinguish between drug effects on less specific features associated with a syndrome-like inflammation or dysphoria from effects on more central features like bacteria in the tissues, or ritualistic or phobic behavior.

In contrast to the general patholytic action of antidepressants which tends to cease when the drug is stopped, the action of exposure treatment is both more specific and more lasting. Exposure therapy is only indicated where there is *persistent avoidance* of some discomforting situation or feeling. Exposure mainly improves rituals and phobias and, after a delay, work and social adjustment which had formerly been crippled by the rituals and phobias. This improvement continues over 2-7 years' followup (Marks, in press-a).

Despite its efficacy for phobias and rituals, exposure leads to a less impressive gain in mood, though this can become significant some time after phobias and rituals improve. Unlike drugs, behavioral treatment dissects apart the dual pathology in obsessive-compulsive and phobic patients. On the one hand, all of them have persistent rituals of phobias which can be specifically helped by exposure *in vivo*, and lastingly so, even though this has limited action on any coexisting dysphoria. On the other hand, in patients who have coexisting fluctuating dysphoria this is temporarily suppressed by antidepressants; as dysphoria improves do so coexisting rituals and phobias. While exposure treatment does not greatly modify disturbed mood, it protects against the reemergence of rituals and phobias in full strength when mood disturbance recurs; it uncouples the two pathologies (Marks 1981).

Are Any Antidepressants Especially Valuable?

Few comparisons are available. For ritualizers, clomipramine was effective in all four studies which used it (Ananth 1980; Insel et al. 1982; Marks et al. 1980; Thorén et al. 1980), but was not significantly superior to nortriptyline or amitriptyline. (Nortriptyline, amitriptyline, and clorgyline were each ineffective in one study (Ananth et al. 1980; Insel et al. 1982; Thorén et al. 1980). Antiphobic effects were found for imipramine in five (Mavissakalian & Michelson 1982; Sheehan et al. 1980; Tyrer et al. 1973; Zitrin et al. 1978, 1980) of seven studies (ineffective in Marks et al., in press; McNair & Kahn 1981), for phenelzine in two (Sheehan et al. 1980; Tyrer et al. 1973) of three studies (ineffective in Solyom et al. 1981), and for iproniazid (Lipsedge et al. 1973) and clomipramine (Pecknold et al. 1980) in one study each. For phobics between-drug comparisons are only available in one study, for phenelzine vs. imipramine (Sheehan et al. 1980); there was little to choose between them.

Problems of Drug Treatment

Relapse after drug withdrawal: In most of the phobic and obsessive-compulsive populations reviewed in this paper the disorder had been present for many years, often for more than a decade, by the time treatment began. In such chronic populations treatments are more valuable if their benefits last for years after the treatment ceases. This is true for exposure therapy but not, unfortunately, for antidepressants. Where a drug effect has been found, there is a uniformly high relapse rate on stopping the drug, even after it has been taken for 6-8 months. This is a drawback to drugs whose side effects over long periods are unclear. It indicates that the pathology is being suppressed rather than cured by such drugs, and there is a tendency for the mood disturbance to persist in a fluctuating manner for years. This finding contrasts sharply with the lasting improvement attributed to exposure treatments, which improved phobias and rituals up to the 2-9 years (reviewed by Marks, in press-a). The pattern of relapse following drug withdrawal, even after prolonged drug administration, is similar to that found with antidepressants in depressive illness, phenothiazines in schizophrenia, and cimetidine in duodenal ulcer.

High dropout rate with drugs in phobics: Another drawback to antidepressants is the high dropout rate found by almost all authors in phobics, these mostly from a quarter to a third (Lipsedge et al. 1973; Marks et al., in press; Mavissakalian & Michelson 1982; McNair & Kahn 1981; Sheehan et al. 1980; Tyrer et al. 1973; Zitrin et al. 1978, 1980). Interestingly, dropouts are common with placebo as well, suggesting that phobics are poor pilltakers. Often they interpret preexisting somatic complaints as drug side effects as soon as they start the drug. These misattributions are an interesting feature of the syndrome which deserve further study.

In contrast, the only three studies to report dropout rates with obsessive-compulsives found these to be 4-14 percent (Insel et al. 1982; Marks et al. 1980; Thorén et al. 1980), comparing well with the 16 percent dropout rate for behavioral treatment as a whole in several hundred neurotic patients treated in the author's unit.

Implications for Research and for Clinical Practice

Future research studies could be better compared if they were to adopt a minimum number of standard measures. These might include a short Beck Depression Inventory and the Hamilton Depression Scale, target ritual or target phobia measures like those of Marks et al. (1980, 1982) and, for phobics only, the Fear Questionnaire of Marks and Mathews (1979) and panic scale of Zitrin et al. (1980).

Plasma monitoring of drug levels is desirable, and a followup for a minimum of a year after cessation of the drugs is essential to check on relapse. Also necessary is report of absolute mean scores, standard deviations, and cell size of each measure at each rating point from pretreatment to end of followup. Such data can be reported in one table taking up merely one journal page, and would greatly facilitate the task of comparing populations and effects across research centers.

Medication in the Treatment of Panic Attacks and Phobic States

Donald F. Klein, M.D.[1]

Diagnostic Issues

In the now superseded Diagnostic and Statistical Manual-II (DSM-II) an anxiety neurosis was characterized by "anxious over-concern extending to panic and frequently associated with somatic symptoms. Unlike Phobic Neurosis, anxiety may occur under any circumstances." A patient with a phobic neurosis might show similar symptoms, but only when exposed to specific situations or objects, though these were consciously recognized as presenting no real danger.

Clinical research findings of the past two decades permit us to more precisely discriminate among anxiety and phobic conditions.

The crucial distinction is that the core event is the spontaneous panic attack, which may lead to the secondary development of anticipatory anxiety and tertiary phobic avoidances. That the panic attack is qualitatively distinct from, and not just an intensification of anticipatory anxiety, is supported by both the course of the disorders and differential pharmacological responses. Spontaneous panic attacks antecede the development of generalized anxiety rather than vice versa. Further, Klein (1964) demonstrated that the spontaneous panic attacks could be blocked by the tricyclic antidepressant imipramine which, however, did not affect anticipatory anxiety. Benzodiazepines and other minor tranquilizers, on the other hand, ameliorate anticipatory anxiety but have no marked effect on the panic attacks themselves. Thus, panic attacks appear to represent a form of anxiety biologically distinct from anticipatory (or "free-floating") anxiety.

This distinction leads to a more useful classification of anxiety and phobic disorders, separating those involving spontaneous panic attacks from those that do not. In DSM-III, the former are classified as Panic Disorder or Agoraphobia with Panic Attacks, depending on whether an individual with spontaneous panic attacks also develops a widespread inability to travel outside the home based in turn on fear of spontaneous panics. The attacks themselves are often episodic, and may clear for no apparent reason after 6-12 months. However, they tend to recur in volleys and occasionally become chronic. In addition, the agoraphobic avoidant and dependent behavior often becomes chronic because after a time the patient may give up trying to enter feared situations.

Other phobias that do not involve spontaneous panics are included in DSM-III as: Agoraphobia without Panic Attacks, Social Phobia, and Simple Phobia. Agoraphobia without Panic Attacks is, in the author's experience, regularly associated with episodic dysautonomic experiences; primarily light-headedness and gastrointestinal distress. Social Phobia is defined in DSM-III as a persistent, irrational fear of, and compelling desire to avoid, a situation in which the individual is exposed to possible scrutiny by others and fears that he or she may act in a way that will be humiliating or embarrassing. Examples of Social Phobia are fears of public speaking or performing in public, using public lavatories, eating in public, and writing in the presence of others. Simple Phobia involves an irrational fear of, and desire to avoid, specific, well-delineated, objects or situations not included in the definitions of Agoraphobia and Social Phobia. These often involve animals, particularly dogs, snakes, insects, and mice, or situations such as closed spaces (claustrophobia) or heights (acrophobia). A trial of imipramine in Simple Phobia showed no specific benefit (Klein et al. 1980), as would be expected if the medication only affected spontaneous panics.

---

[1] New York State Psychiatric Institute, New York, NY 10032.

Physical disorders such as hypoglycemia, pheochromocytoma, hypercaffeinism, hyperthyroidism, and withdrawal from sedatives may cause symptoms similar to a panic attack and must be ruled out when making the diagnosis of Panic Disorder or Agoraphobia with Panic Attacks. These diagnoses are not made in DSM-III if the panic attacks are symptomatic of another mental disorder, such as Schizophrenia, Major Depressive Disorder, or Somatization Disorder.

It may be a mistake not to diagnose Panic Disorder in the presence of major depressive disorder, since recent findings indicate that concurrent depression and Panic Disorder may have a higher degree of familial loading than depression alone (J. Leckman and M. Weissman, personal communication).

A number of features complicate the clinical picture and serve to obscure the diagnosis of Panic Disorder. Some patients manifest symptoms of depersonalization or derealization during a panic, which may also occur at times other than the panic attack. There may also be a relationship between separation anxiety in childhood and panic attacks, since between 20 percent (outpatients) and 50 percent (inpatients) of agoraphobic adults who come for treatment have a history of separation anxiety in childhood, often manifested as difficulty attending school (Klein 1964). It is noteworthy that imipramine has benefited school phobics refractory to psychotherapy in a controlled clinical trial (Klein et al. 1980).

Adult patients with Agoraphobia with Panic Attacks, who may present as housebound, desperately clinging, and fearful of being alone, have often been regarded as infantile personalities with severe, unmet dependency needs. The tendency has been to regard their symptoms as evidence of a failure to master the early stages of psychological development involving object constancy and separation-individuation. Long courses of psychoanalytic treatment were often prescribed which, in the light of recent findings, are not likely to be the treatment of choice.

Other complications of panic attacks are alcohol or sedative abuse. These may involve attempts at self-medication, which diminish anticipatory anxiety but have no effect on blocking panic attacks. Hence the dosages are often increased until physical or psychological dependence supervenes. An inquiry about antecedent panic attacks should always be included in the evaluation of alcohol- or sedative-abusing patients.

Panic attacks may also occur in conjunction with depressive illness (Pariser et al. 1979). At times the panic attacks may be the original symptom, with depressive complaints supervening. Most often this involves demoralization in response to the travel restrictions and attendant loss of self-esteem, and lacks many of the vegetative and autonomous mood disturbance features of a full-blown depressive syndrome. On the other hand, the illness may start with a major depression and be complicated by the subsequent development of panic attacks.

Several recent reports have also linked anxiety-panic syndromes to cardiovascular disorders such as hyperdynamic beta-adrenergic state (Easton & Sherman 1976; Frolich et al. 1969) and mitral valve prolapse syndrome (MVPS) (Pariser et al. 1979). While hyperdynamic beta-adrenergic circulatory state was originally described in patients who had attacks of palpitations, chest discomfort, or tachycardia after exercise or stress (Frolich et al. 1976), it has more recently been reported as brief episodes of nervousness or anxiety, often occurring without physical or emotional precipitants, that can be reproduced by isoproterenol infusions and blocked by maintenance propranolol (Easton et al. 1976). These findings suggest that some panic-attack patients may have increased beta-adrenergic receptor site reactivity.

Lactate Infusions and Panic Attacks

Patients with spontaneous panic attacks may have a pathophysiological aberration, since intravenous lactate infusions precipitate panic attacks in such individuals but not in normal controls (Pitts & McClure 1967).

This finding, established under double-blind circumstances, has been amply replicated by numerous investigators (Appleby et al. 1981;

Bonn et al. 1971; Fink et al. 1970; Kelly et al. 1971). It must be considered one of the better demonstrated facts in the experimental precipitation of psychopathological states. The meaning of this finding, however, still remains obscure. For instance, Pitts and McClure (1967) believe that the panicogenic effect was due to the chelation of calcium; they demonstrated that adding calcium to the sodium lactate mitigated the occurrence of panic attacks. Fink et al. (1970) replicated this finding.

Ackerman & Sachar (1974) raised the question whether there was truly a specific panicogenic effect from lactate. Perhaps some sort of conditioned response was responsible. During the lactate infusion autonomic symptomatology slightly reminiscent of the onset of the panic attack may occur which might engender a panic attack in patients, but not in normals who had not learned such a sequence.

Although possible, this hypothesis seems contradicted by several bodies of fact. First, EDTA infusions administered by Pitts (1967) produced profound hypocalcemic symptoms but no anxiety attacks in either anxiety neurotics or controls. Such infusions should certainly produce sufficient autonomic disturbance to throw patients into a panic attack if all that was required was a nonspecific trigger. Second, lactate-induced panic attacks resemble spontaneous panic attacks with regard to the blocking effects of antidepressants. Kelly's group (1971) induced panic attacks in eight agoraphobic patients and then treated them with phenelzine. Five of the eight patients responded well to the medication and did not have panic attacks upon reinfusion with lactate; the remaining three patients did not respond well to phenelzine and did reexperience panic attacks upon reinfusion with lactate.

More recently the author's research group has administered lactate infusions to 62 patients with Panic Disorder; 43 experienced panic attacks. After clinical recovery with imipramine, and while still on the drug, 28 were reinfused; only four showed evidence of a panic attack.

Even more telling, in a double-blind procedure 16 patients in remission from Panic Disorder were randomized to either continue on tricyclic antidepressants or to be withdrawn onto the peripherally acting anticholinergic drug, methscopolamine. After a month, they were reinfused with lactate. None of these patients panicked.

Pharmacotherapy

Tricyclic Antidepressants

That imipramine would block panic attacks (Klein 1964, 1967; Klein & Fink 1962; Zitrin et al. 1978) is of heuristic and practical importance. Agoraphobic patients with panic attacks had often been thought of as having a fear of open spaces or other specific situations, with long outpatient psychotherapies devoted to an exploration of unconscious sexual and aggressive impulses; the phobically barred areas were seen as symbols of forbidden temptations. Patients given imipramine report a dramatic decrease or cessation of panic attacks, however, many are still reluctant to change their phobic behavior patterns. Thus, persuasion, direction, support, or minor tranquilizers are often required, once the panic attacks had been blocked, to help patients extinguish their anticipatory anxiety which is not ameloriated directly by the tricyclic antidepressants, and to reenter the phobically avoided situations.

Monoamine Oxidase Inhibitors

Monoamine oxidase inhibitors are also effective in blocking panic attacks. Sheehan et al. (1980) recently reported a study in which phenelzine (45 mg/day) was at least as effective, if not more so, than imipramine (150 mg/day) in treating agoraphobics with panic attacks. That both major classes of antidepressants are effective in treating panic attacks should prove of marked heuristic importance.

Other Agents

In a detailed, thoughtful review of 16 controlled or partially controlled studies of beta-adrenergic blockers in anxiety disorders, Cole et al. (1979) concluded that this class of drugs may have a weak antianxiety effect. Specifically, the drugs often appear more helpful with somatic than with psychic aspects of anxiety. This conclusion was also reached in a recent study by Noyes et al. (1980), who did a propranolol-placebo crossover study in patients with panic disorder. As such, it is useful for treating the anxiety symptoms that accompany the fear of public speaking and other social phobias. However, no controlled study has systematically examined the specific efficacy of propranolol in blocking panic attacks.

As mentioned before, minor tranquilizers are helpful in treating the anticipatory anxiety of Panic Disorder patients, but do not block the panic attacks. Preliminary findings of a controlled study by McNair and Kahn (1980) support this clinical impression. Panic attacks are also refractory to all classes of antipsychotic drugs, which may even exacerbate the condition. Because these patients are often considered borderline, and seen as decompensating when in acute panic, antipsychotics are often administered with a worsening of symptoms, use of more drug, further worsening, etc. leading to a vicious cycle (Klein 1962, 1964).

Hoehn-Saric et al. (1981) recently reported a double-blind, crossover placebo control study of clonidine in 23 patients. Nine patients were diagnosed as General Anxiety Disorder, and 14 as Panic Disorder. The period of active drug treatment was 2 weeks. The effect of clonidine was comparable in both anxiety disorders, and superior to placebo in patients who tolerated the drug. The main effect of clonidine was a decrease of anxiety attacks and psychic symptoms. No difference was found in the effectiveness of either drug for the two anxiety disorders. Hoehn-Saric (personal communication) reports a waning of clonidine beneficial effects with time.

An open pilot study of clonidine was conducted (Liebowitz et al., in press) in 12 patients with Panic Disorder. Only a third of the patients showed sustained improvement over a 6-week period. One third showed a transient improvement, which would have been registered as a positive course in Hoehn-Saric's (1981) 2-week trial, and a third was unable to tolerate the drug. Since clonidine also shows a waning of its inhibitory effect upon the locus coeruleus. this disappointing clinical finding may still be of marked theoretical importance.

A new drug, alprazolam (Xanax), a triazolobenzodiazepine with supposed antidepressant effects, may also be an antipanic drug. (Sheehan, personal communication).

Is the Antipanic Activity of Antidepressant Medication a Reflection of Antidepressant Effects?

Marks has recently completed a study of the imipramine treatment of agoraphobic patients, and found no benefit from imipramine (Marks et al. in press). There are several problems with this study, including the dosage level attained and the statistical analysis. It is also not unusual for a Type II statistical error to occur in the study of active compounds; that is, not finding statistically significant effects when they, in fact, exist.

Marks, however, has suggested the alternative hypothesis that imipramine is only beneficial in the treatment of depressed agoraphobic patients and that the antipanic effect is actually part of a general patholytic effect. This line of thinking is supported by his findings in the chlorimipramine treatment of obsessive-compulsive disorder, where concurrent depression seemed necessary for beneficial drug effect. Marks also interprets a study by Thorén et al. as supportive of this viewpoint.

This is a controversial area. Marie Åsberg (personal communication) has disagreed with Marks' interpretation of this data. However, this discussion will be restricted to Marks' agoraphobia data, since there is no necessary parallel between drug effects on obsessive-compulsive disorder and agoraphobia.

Marks' handling of the term "depression" does not deal with the real difficulties in understanding just what different authors are referring to when they use this ambiguous word. In particular, the distinction of depression from demoralization seems crucial, since demoralization is a nonspecific response to many life defeats that manifests itself in depressive complaints. However, it is not generally considered to be a drug responsive depressive condition.

Marks has tabulated a number of studies where there are measures available that indicate that his sample, and the sample of Solyom et al. (1981) were relatively low in depression, and that this is consonant with his views concerning the essential role of depression in allowing therapeutic benefit. Unfortunately, the Solyom study is not good evidence, since the sample contains an unstated proportion of social phobics, who are not generally considered drug sensitive. Therefore, Marks' study remains entirely alone in finding a lack of antidepressant benefit in agoraphobic patients.

When Zitrin and colleagues' study (1978) was compared to Marks' in terms of baseline depression measures, on the one measure where comparability was possible, there was no difference between samples. Further, in Zitrin's study there was no antidepressant effect of imipramine. This is not surprising, since in this study patients with more than moderate levels of depression, or with diagnosable major depressive disorder, were specifically excluded. Since there was no specific antidepressant effect, it is hard to see how an antidepressant effect could be a precondition for a therapeutic effect of imipramine in agoraphobic patients.

Marks points to the study of McNair and Kahn (1980) and of Sheehan (1980) where antidepressant effects were found as contradicting Zitrin's findings. However, in neither of these publications is there any indication that depressed patients were excluded from these studies. Further, in an analysis by Sheehan, no relationship was found between his measures of depression and antiphobic drug effect.

In the McNair and Kahn study (1981) there was a more complicated finding. Their results were analyzed for the 26 completers who were randomized to imipramine or chlordiazepoxide. They found that the imipramine effect on panic attacks was independent of degree of depression present in the sample. With regard to agoraphobia, that is avoidant behavior as a target, the best imipramine responders were the more depressed who were also more phobic. Because of the high correlation between degree of depression and phobia, these effects could not be statistically disentangled.

McNair and Kahn (1981) did not find a main imipramine effect on agoraphobia (avoidance behavior) but agreed that there was a definite effect on panic attacks. This finding is quite consistent with Klein's hypothesis that the initial antidepressant effect is blockading the panic attacks, and that the decrease in avoidant behavior is secondary. McNair's study lasted for only 8 weeks. This is a period that would allow for the development of antipanic effects, but would probably not have increased substantial secondary decreases in avoidance as indicated in the study of Zitrin et al. (1978).

Marks also discusses the possibility that antidepressants are broadly patholytic, while exposure is more specifically antiphobic. He asserts that drug effects are not restricted to phobias, rituals, and anxiety-depression, but seem more general. He supports this by referring to a group of univariate analyses which show many improvements with medication.

There are real methological problems with such an interpretation of multiple univariate contrasts. One does not know whether there is a general patholytic effect or whether there are a host of independent effects, or there is a central effect with a number of secondary beneficial reverberations. Finally, there may be a marked halo effect so that improvement in one area erroneously induces a perception of improvement in other areas. These methodological complexities are not alluded to. Further, other authors have shown a distinctly more spotty pattern of drug effects.

One problem is that it is not clear whether Marks is raising a strong hypothesis of general patholysis. If he is insisting that drugs always affect all symptoms, he is clearly wrong. If he is simply stating that drugs have effects on areas over and above phobias, anxiety, and depression, he is clearly right but the meaning of this remains to be elucidated.

Marks also states that it is misleading to focus on panic attacks since imipramine has effects on many other pathological features *simultaneously*. However, his data base does not allow this assertion of simultaneity.

Unfortunately the data regarding the effects of imipramine over an extended period of time are not definitive. The author's hypothesis that the effect is first upon panic attacks, and then secondarily upon anticipatory anxiety and avoidance has not been demonstrated in a longitudinal controlled way. It is quite consonant, however, with very extensive clinical therapeutic experience. It is also consonant with followup findings that relapse is initiated by the recurrence of spontaneous panic attacks. Finally, the blockade of lactate-induced panic attacks by antidepressants argues against considering the panic attack as just one more symptom.

Summary

The general question of the utility of medication in the treatment of Panic Disorder and Agoraphobia with Panic Disorder is reviewed. The utility of antidepressants is particularly striking. The claim that these beneficial effects depend upon the presence of concurrent depression with panic attacks, and that antidepressants have a general patholytic effect is critically examined.

Studies of the blockading effects of imipramine upon lactate-induced panic attacks also indicate a specific antidepressant-panic disorder interaction that is not related to depression.

Agoraphobia: Behavioral and Pharmacological Treatments, Preliminary Outcome, and Process Findings[1]

Matig Mavissakalian, M.D.,[2] and Larry Michelson, Ph.D.[2]

Introduction

Within the last two decades agoraphobia has become well delineated as a syndrome in its own right (Hallam & Hafner 1978; Marks 1969; Snaith 1968), and this recognition has been coupled with the development of effective behavioral and pharmacological treatments (Mavissakalian & Barlow 1981a). The behavioral treatments which aim primarily to reduce phobic anxiety and avoidance share a common denominator, namely exposure to feared stimuli (Mavissakalian & Barlow 1981b). A number of analogues as well as clinical studies have demonstrated the superiority of *in vivo* exposure to imaginal exposure (Barlow et al. 1969a, 1970; Crow et al. 1972; Emmelkamp & Wessels 1975; Stern & Marks 1973). However, variations in the practice of *in vivo* exposure (e.g., prolonged exposure, successive approximations, therapist-assisted, home-based individual or group treatments), seem to be equally effective (Emmelkamp 1974; Emmelkamp & Ultee 1974; Everaerd et al. 1973; Hafner & Marks 1976; Hand et al. 1974; Mathews et al. 1977; Teasdale et al. 1977). New developments in the pharmacological treatment of agoraphobia have drawn attention to the antidepressant group of drugs, and numerous clinical studies have shown that both the monoamine oxidase (MAO) inhibitors (Kelly et al. 1970; King 1962; Mountjoy et al. 1977; Tyrer et al. 1973a, 1973b; Tyrer & Steinberg 1975) and the tricyclics (Colgan 1975; Klein 1964, 1967; Klein & Fink 1962; Marshall & Micev 1975; Sheehan et al. 1980; Waxman 1975; Zitrin et al. 1978, 1980) can be very effective.

To date, the literature does not permit definitive conclusions regarding the relative effectiveness of exposure and antidepressant treatments of agoraphobia, as controlled studies directly comparing these two treatments have not been reported. However, despite the existing methodological and assessment differences between studies cited above, certain overall similarities and differences emerge. First, it appears that dropout rates are comparable in behavioral and pharmacological studies and that they hover around 25 percent. Second, improvement rates are also comparable and center around 70 percent of treated patients. However, a major difference between these two treatments occurs in regard to relapse rate: Whereas improvement with exposure treatments is known to be maintained over long followup periods (Emmelkamp & Kuipers 1979; Marks 1971; McPherson et al. 1980), nearly 30 percent of patients experience relapse following cessation of antidepressants (Klein 1964; Klein & Fink 1962; Sheehan et al. 1980; Tyrer & Steinberg 1975; Zitrin et al. 1978, 1980). One of the major aims of this study, therefore, was to directly compare the effectiveness of *in vivo* exposure (flooding) and imipramine in the treatment of agoraphobia.

The literature suggests that antidepressants act by controlling or suppressing panic attacks (King 1962; King & Fink 1962; Klein 1964; Sheehan 1980; Zitrin 1978, 1980) and that exposure *in vivo*

may be the final common pathway leading to habituation or extinction of phobic anxiety and avoidance behavior (Mavissakalian & Barlow 1981b). It would follow that a combination of these two effective treatments with different mechanisms of action might prove maximally beneficial to the patient. Previous investigations of the combined behavioral-antidepressant treatment of phobias are rare, and until recently none had studied a homogeneous group of agoraphobics, nor had any study utilized exposure *in vivo,* the behavioral treatment of choice (Lipsedge et al. 1973; Solyom et al. 1973; Zitrin et al. 1978. The only exception is a study by Zitrin et al. (1980) comparing combined exposure-imipramine and exposure alone in 76 agoraphobic patients. They found that the majority of patients in both groups improved but that the combined treatment showed more improvement in panic and marked global improvement ratings. The second major aim of this study, therefore, was to directly compare the effectiveness of the combined flooding-imipramine treatment to that of flooding alone and imipramine alone.

Another major aim was the investigation of possible differential rates and patterns of change across the treatments. Because of the presumed differences in the mechanism of action underlying the effects of flooding and imipramine, and the possibility of an additive or synergistic effect in their combination, it was hypothesized that: 1) significantly greater change would be found earlier with the combined treatments than with the individual treatments, 2) mood, as measured by panic, anxiety, and depression, would improve earlier in treatment with imipramine than with flooding, 3) phobia and avoidance behavior would improve earlier in treatment with flooding as compared with imipramine and, 4) concordance between all measures of change would be greater in the later, rather than earlier phases of treatment due to desynchronous patterns of change, initially, across measures.

Finally, the question of nonspecific factors in psychiatric treatment is both a troublesome and a fascinating one. Troublesome, because if not properly isolated and controlled, far more credit will go to the presumed active therapeutic ingredients. Fascinating, because nonspecific factors could be looked upon as respectable treatments in their own right. In the special case of agoraphobia, practicing *in vivo* exposure between sessions seems to be the final common pathway for any successful treatment and it is possible, indeed likely, that a certain percentage of patients might improve with instructions, encouragement, and support by a therapist (Gelder et al. 1973; Jannoun et al. 1980; Mathews et al. 1976; McDonald et al. 1979). The third major aim of this study, therefore, was to assess the true effectiveness of the imipramine, flooding, and the combined imipramine-exposure treatments compared to a control group receiving nonspecific treatment.

In 1980 a clinical research program was established at Western Psychiatric Institute and Clinic at the University of Pittsburgh to investigate flooding and imipramine treatments in 80 agoraphobic patients. This paper reports the results of the first 32 subjects who entered the project.

Method

Subjects

The 32 subjects of this study were selected on the basis of the following inclusion criteria: 1) Diagnostic and Statistical Manual-III (DSM-III) diagnosis of Agoraphobia, 2) age of onset prior to age 40, 3) duration of present illness of at least 1 year, 4) a score of 4 or greater on the clinician rating of global assessment of severity, and 5) failure to complete either the standardized behavioral test or the idiosyncratic behavioral test or completing both behavioral tests while experiencing definitive anxiety (a rating of 4 or more on a 0-8 scale of anxiety). Exclusionary criteria were: 1) presence of features indicative of and/or previous diagnosis of Major Affective Disorder, Schizophrenia, Organic Brain Syndrome, and Obsessive-Compulsive Disorder, 2) social phobics and anxiety neurotics without the typical fears of going out alone to open spaces, streets, shops, crowds, cars, and means of public transport, and 3) presence of physical illness precluding the use of imipramine either because of the illness itself or because of treatment necessary for that illness. Additionally, patients selected for the study were withdrawn from psychotropic medications at least 2 weeks prior to initiation of treatment. This selection process eliminated 27 diagnosed agoraphobics. The main reasons for their rejection, in decreasing order, were mild condition, physical or medical problems, and refusal to take experimental medications.

The 32 patients had a mean age of 39 years. There were 5 males and 27 females: 2 were single, 3 divorced, and 27 married. The majority were white with only 2 blacks. The average duration of illness was 14 years. Ninety-one percent of the patients had received previous psychiatric treatment of an average duration of 22 months. Eighty-seven percent of the patients had received anxiolytic medication, 32 percent had received antidepressants, and none had been prescribed antipsychotics. Only 16 percent of the patients had been previously hospitalized.

Six patients did not complete the treatment phase. All of them were females. One patient withdrew after two sessions because she was hospitalized with gynecological problems for possible hysterectomy. Two patients attended two sessions each but quit because they preferred to return to conventional group therapy. One patient withdrew after one session because of difficulty in arranging transportation to the clinic. The last two patients missed several sessions in a row and were disqualified. Additionally, three patients discontinued drugs within the first 2 weeks of treatment but completed the entire treatment phase. For the purposes of data analysis, they were reassigned to the placebo (no medication) group. Thus, the final composition of the groups was as follows: Imipramine/Flooding—five patients, Imipramine—six patients, Flooding—six patients, and Nonspecific treatment—nine patients.

Treatment Conditions and Design

The experimental design of the study is a 2 × 2 factorial design with eight patients randomly assigned to each of the four following treatment conditions: Group IF (combined treatment group) consisted of patients receiving 1) imipramine; 2) 90-minute group flooding; and 3) individual 15-minute therapeutic instructions. Group I (imipramine treatment group) consisted of patients receiving 1) imipramine; 2) 90-minute group discussion; and 3) individual 15-minute therapeutic instructions. Group F (flooding treatment group) consisted of patients receiving 1) placebo; 2) 90-minute group flooding; and 3) individual 15-minute therapeutic instructions. Group NS (nonspecific treatment group) consisted of patients receiving 1) placebo; 2) 90-minute group discussion; and 3) 15-minute individual therapeutic instructions. The entire treatment phase consisted of 12 weekly sessions.

Drug Treatment

Patients were assigned to either imipramine or matched placebo according to a predetermined randomization order known only to the hospital pharmacist. Thus, drug treatment was double-blind. In the weekly individual sessions, one tablet of imipramine 25 mg or placebo was prescribed at bedtime and increased by 25 mg increments every second day until a tolerable maintenance dosage or a maximum of 200 mg (8 tablets) was reached. The average maintenance dosage of imipramine attained in the last month of treatment was 119 mg per day (range 25-200 mg) and that of placebo was 166 mg (range 50-200 mg).

Behavioral Treatment

In addition to the individual sessions, patients, in groups of eight, were assigned alternatingly to either flooding or discussion conditions. In the flooding condition, they were encouraged to enter their most phobic situations either alone or with the assistance of the therapist at first. This typically involved going to the center of town, visits to department stores and shopping malls, bus rides, and walking in congested areas alone uninterruptedly for longer and longer distances. The patients assigned to the group discussion met with the same therapist for general discussion of their phobias and their progress. Instructions and reinforcement for self-controlled *in vivo* practice were repeatedly given, and general practical suggestions such as engaging the help of a friend or spouse and/or selecting certain specific phobic situations for that particular week's practice were offered. However, specific cognitive strategies such as paradoxical intention or self-statement training were not given. The mean number of sessions attended by the patients was 11.

Therapeutic Instructions

All patients were given the same therapeutic rationale and instructions. Briefly, they were told that the reason why their fears had continued and even increased with time was due to their habitual avoidance behavior, and that in order to overcome their fears and anxieties they should stop avoiding and start entering their phobic situations. It was strongly suggested to them that once in a phobic situation, they should remain there and tolerate the anxiety-discomfort until it decreased to fairly comfortable levels and/or until their urge to escape abated (i.e., habituation took place). They were also told that it is a good principle to proceed with their self-controlled exposure practices along a hierarchy from the least to the most phobic situations. Their progress was reviewed weekly, reported gains in improvement were reinforced, and patients were encouraged to proceed with their self-controlled *in vivo* practices. Furthermore, it was emphasized to them that whatever additional treatment they received, such as the drugs and the group treatments, was designed to facilitate their carrying out self-controlled *in vivo* exposure practices.

Therapists

The same psychiatrist (MM) saw all the patients in the weekly 15-minute individual sessions, and the same clinical psychologist (LM) conducted the group sessions.

Assessment

A comprehensive assessment battery consisting of clinical ratings of severity of illness, general symptom checklist, clinical ratings of phobia, anxiety, panic, and depression as well as direct measures of agoraphobia in behavioral, subjective, and physiological response systems was administered at pretreatment, at 4, 8, and 12 weeks of treatment, and at 1 month posttreatment. The rationale for using these numerous measures was to enable subsequent and more detailed psychometric and clinical analyses of their inter- and intrarelationships. The authors are currently examining these widely used outcome measures in regard to both internal consistency (i.e., Kudar-Richardson 21 reliabilities, factor analysis, and item analyses), and external validity (i.e., discriminant, convergent, concurrent, and predictive).

Results

Repeated measures analysis of variance (ANOVAS) were performed across pre-4-8-12 weeks and 1 month posttreatment assessments and between the four experimental conditions, as presented in Table 1, and indicated significant main effects, repeated measures effects, and interaction effects on numerous dependent measures.

Outcome Analyses

Two (medication vs. placebo) × two (flooding vs. discussion) analyses of covariance were performed on all major dependent measures at the 1 month posttreatment assessment. The results, as presented in Table 2, show significant main effects, medication effects, flooding effects, and interaction effects for the vast majority of the measures. Indeed, there were significant main effects across all domains of functioning including severity of illness, phobia, anxiety, depression, and behavioral measures of phobic anxiety and avoidance. In regard to medication effects significant findings were also obtained within each of these above domains. Similarly, flooding effects were pronounced across all domains, except for the two depression measures. As can be seen in Table 2, significant interaction effects were also obtained on all but two measures.

After obtaining statistically significant main effects, the four experimental groups were compared using Neuman-Keuls posthoc analyses (see Table 1). The results indicated that the nonspecific (NS) control group was significantly less effective than the other three treatments. Indeed, the NS group evidenced statistically significant weaker therapeutic effects on 10 major dependent measures across all domains of functioning. However, as can be seen in Table 1, there were no significant differences between the imipramine and the flooding groups. Furthermore, no significant differences were found between the combined treatment (IF) and its individual components. These results suggest equivalency across the flooding, imipramine, and combined treatments.

Next, a series of clinically oriented analyses were performed based on operationally defined measures of improvement and end-state functioning. Table 3 shows that at 1 month posttreatment assessment, 73 percent of the patients had improved highly and 58 percent were functioning at a high level.

Table 3

Improvement and End-State Functioning at the 1-Month Posttreatment Assessment

Number of Criteria Met (Maximum-4)	Improvement		End-State Functioning	
	N	%	*N*	%
0	2	8	5	19
1	3	12	2	8
2	2	8	4	15
3	11	42	6	23
4	8	31	9	35

Chi-squares were then performed to compare patients scoring low (0-2) vs. those scoring high (3-4) on improvement and end-state functioning across the four experimental treatment conditions. The results were statistically significant (improvement: Chi-square = 14.14, 4 *df*, $p < .01$, ETA = .74; end-state: Chi-square = 17.26, 4 *df*, $p < .001$, ETA = .81) and revealed that the three active treatments were superior to the NS group. Indeed, none of the active groups had cases of low improvement in contrast to the NS group where the majority of patients (e.g., 75 percent), evidenced a low level of improvement.

Finally, the presence (+) or absence (−) of spontaneous panic attacks (SPA) was assessed. At pretreatment, 69 percent of the patients were SPA (+), while at 1-month posttreatment this had declined to 27 percent. Furthermore, interesting differences emerged between the four experimental conditions. Sixty percent of the patients in the IF group were SPA (+) at pretreatment, which declined to 0 percent at 1-month followup. The figures were identical, pre-50 percent and 1-month followup 17 percent SPA (+), for both the I and F conditions. In the NS group, 75 percent were SPA (+) at pretreatment and this had declined to only 50 percent at 1 month followup.

Process Analyses

To ascertain during which assessment phase(s) significant changes occur, sequential *t*-tests were performed comparing pre-4, 4-8, 8-12, and 12 weeks-1 month posttreatment segments in the overall group and within each experimental condition.

Table 4 presents the results which reveal that significant changes occur early on many measures and that there is a reduction in the number of measures reaching significance in subsequent phases of treatment. It is interesting to note that in the first month of treatment, 11 out of the 14 measures achieved significant changes with the combined treatment. The same effect was obtained with imipramine, whereas only seven measures reached significance with flooding. The notable difference between I and F were measures of anxiety and depression. Furthermore, four of the central measures of agoraphobia also show significant improvement with the nonspecific treatment in the first month of treatment, supporting the therapeutic usefulness of providing rationale and instructions to agoraphobic patients.

The second and third months of treatment seem to be a period of consolidation of gains, with fewer measures reaching significance. This would suggest that with the active treatments, major gains occurred in the first month of treatment, with improvement continuing to occur up to 1 month posttreatment. Interestingly, measures of agoraphobia as well as depression and performance improved significantly in the second month of treatment even with the nonspecific treatment. However, little change occurred after this period with this treatment, suggesting that its effectiveness is limited to the initial phase of the intervention.

In contrast, significant improvement on measures of phobia and anxiety continued to take place with flooding in the posttreatment phase. This would suggest that patients treated with flooding continue their treatment, on a self-directed basis, thus consolidating gains after formal termination of therapy. In addition, the imipramine group, far from relapsing, seems to experience further reduction in the severity of their agoraphobic condition.

Table 1 also illustrates the Neuman-Keuls posthoc comparisons of the experimental treatment conditions at each assessment. Two comparisons at Week 4 reached significance, indicating that the imipramine condition alone was superior to the control treatment on clinical anxiety and depression measures. However, there were no significant differences between the three active groups. By Week 8 the three active treatments still did not differ significantly, although imipramine and flooding treatments differed significantly from nonspecific treatment on a clinical anxiety measure and flooding, in addition, differed significantly from the nonspecific group on a depression measure. At the 12-week assessment, and at the 1 month posttreatment assessment, the three active treatments did not differ significantly from one another but achieved significantly greater results compared to the nonspecific group on most measures.

The Figure illustrates these differential patterns of change and underscores the marked and rapid improvement in mood which imipramine induces and which is apparent by Week 4. It also shows that similar changes occur with flooding but that this treatment may require up to 8 weeks to equal the changes seen with imipramine. On both measures of anxiety and panic, rate of improvement levels off with imipramine between 4-8 weeks of treatment, whereas improvement maintains a steady pace with flooding. Moreover, improvement in depression is rapid and equivalen for both imipramine and flooding treatments i the first month. Further improvements continu with both treatments, albeit more gradually wit flooding. Finally, on the measure of agoraphobi anxiety and avoidance, the course of improvement with both treatments is identical. Interestingly, improvement in subjective anxiety experienced during the behavioral avoidance te does not improve in the first 4 weeks of treatmen except with the combined imipramine/floodin treatment. This is puzzling, because in the same period flooding remains unchanged and imipramine induces a worsening on this measure. Furthermore, this apparent advantage of the combined group is lost by Week 8. On this measure, and in contrast to the other measures of mood, major changes seem to occur in the later phases o treatment and appear to be associated mor strongly with flooding.

Table 4

	Behavioral	.51	.58	.95	.95	.95[c]
Anxiety	Depression	.53	.84[a]	.85	.90[b]	.79[b]
	Behavioral	.73[a]	.69	.66	.81	.75
Depression	Behavioral	.46	.19	.55	.83	.74

[a] $p < .05$ [b] $p < .01$ [c] $p < .001$

Note: The size of the correlation needed to achieve statistical significance may differ across assessments due to varying sample sizes. Thus, the absolute lev correlation in addition to the resultant significance level, should be considered.

Next, multivariate canonical correlation analyses were performed to evaluate the patterns of relationship between the different domains of assessment in the course of treatment. Based on hypothesis of differential rates and patterns of change across treatments and measures earlier in treatment, the authors expected to find low correlations among the various domains earlier in treatment, and higher correlations in the later phases of treatment.

Table 5 presents the domains, their constituents, and the results of the canonical correlations at all assessments. The results depict a steady increase in the percent of domains correlating significantly as well as a parallel rise in the strength of the correlations as treatment progresses. These results strongly support the idea of differential rates and patterns of change across measures occurring in the early phases of treatment and justify further explorations in regard to the phenomena of synchrony/desynchrony and concordance/disconcordance across treatments and domains, as discussed by Hodgson and Rachman (1974). Moreover, these results add support to the use of multiple process/outcome measures with which to delineate these phenomena.

Finally, patients were divided into two groups, depending on whether they met 0-2 (LEF) or 3-4 (HEF) of the end-state functioning criteria (*see* Table 3) and compared across each assessment phase. The results of the *t*-tests showed no pr treatment differences between HEF and LEF pa tients. However, by Week 4, significant dif ferences emerged on many of the major depen dent measures, in favor of the HEF group. Thi pattern continued at Week 8, and by the 12-wee assessment showed increases strength in regard t both the number and size of the differences.

Discussion

The degree of improvement found in the entir sample reflects the overall effectiveness of th clinical research project. Despite the inheren methodological constraints (nine patients receive nonspecific control treatment), the overall level o improvement compares favorably with previousl reported outcome studies with imipramine o flooding (Mavissakalian & Barlow 1981a). Thus the magnitude of change on the clinical scales (2- point decrease on 9-point scales are considere marked improvement in the literature), the co sistent statistical significancy obtained on near all measures, and the finding that 73 percent o the patients witnessed a high level of impro ment with nearly 60 percent enjoying a high leve of functioning, all indicate that the research pro gram was also highly therapeutic. The autho believe this is an important point becau agoraphobic patients, like most chronicall disabled groups, enter clinical research projects with great expectations of being helped—which it appears were in great measure fulfilled in the current project.

The results show that flooding and imipramine are highly and equally effective in the treatment of agoraphobia. Although was found partial support for the hypothesis predicting earlier improvement in mood with imipramine, mood was also found very responsive to flooding and the two treatments did not differ from Week 8 of treatment onward. These results suggest the exercise of extreme caution in attributing an exclusive etiological treatment status to pharmacotherapy which purportedly would treat the core problem of "endogenous anxiety" in agoraphobia (Sheehan et al. 1980).

The results did not support the hypothesis which predicted that phobic avoidance and anxiety would improve earlier with flooding. In fact, there was suggestive evidence that anxiety, experienced during the behavioral testing, improved in the later phases of treatment, even in those patients treated with flooding. In a recent study, (Mavissakalian & Michelson, in press) which investigated differential rates and patterns of change between the three response systems of behavioral performance, subjective anxiety, and physiological responsiveness measured by heart rate, it was found that clinical and behavioral improvement occured early in treatment followed by improvement in subjective anxiety and heart rate in the intermediate and later phases of treatment. These results were interpreted as supporting the hypothesis advanced by Hodgson and Rachman (1974) predicting that psychophysiological improvement would lag behind behavioral improvement in flooding or similar behavioral treatments with high demand characteristics. Such high demand characterized the treatment of all the patients who were repeatedly instructed to practice self-directed flooding. The increased concordance between all domains of assessment in the later phases of treatment adds further support to the predictions of change advanced by Hodgson and Rachman concerning treatments with high demand characteristics.

A major and unexpected finding was the failure of the combined imipramine flooding treatment to show a clear superiority over the individual treatments. *Therefore, when therapeutic rationale and instructions to practice in vivo exposure are given to patients, it appears that imipramine, flooding, or their combined treatment are highly and equally effective in the short-term outcome of agoraphobia.* This finding raises serious questions as to the need for combined treatments in agoraphobia and suggests that the primarily clinical advantage stemming from the combined treatment would be the possibility of reduced relapse rates, compared to pharmacotherapy alone. The prolonged followup phase planned in the completed research project will address this question. However, preliminary findings of a 6-month followup reported by Zitrin et al. (1980) are not encouraging since they revealed that 27 percent of agoraphobic women treated with combined imipramine and flooding relapsed, a figure which is as high as those encountered with antidepressants alone (Sheehan et al. 1980).

Therapeutic rationale and instructions to practice *in vivo* exposure, even though systematically prescribed over a 3-month period, seem to be inadequate by themselves. In this condition, some improvement seems to take place in the first 8 weeks of treatment but subsequently levels off. This contrasts with the marked improvement noted in the earlier phases as well as the continuing improvement in the later phases of active treatments, and suggests that this is a weak and time-limited treatment. However, the observation that two out of the nine patients in this group showed high levels of improvement suggests that in a small percentage of agoraphobics these nonspecific treatment factors can be sufficiently effective in their own right and, furthermore, that in this weaker treatment certain patient characteristics might prove crucial in determining substantial degrees of improvement.

In regard to the differential patterns of change between low end-state and high end-state functioning patients, it was observed that more rapid treatment gains occurred among the high end-state functioning group. Indeed, these patients were already showing significant improvement by the 4th week and continued to accelerate their therapeutic responses across subsequent assessment phases. Conversely, the low end-state functioning group showed significantly slower and smaller treatment gains. These findings suggest that early changes in treatment could be extremely useful in identifying responders, and that clinicians might incorporate these findings into their treatment by considering alternative interventions for patients who fail to show gains by Weeks 4 or 8. On the other hand, pretreatment baseline measures did not differ between responders and nonresponders and therefore do not seem likely to provide prognostically helpful information at this time.

If the completed projects' results confirm these preliminary findings, it would raise the question and search for a common factor to explain the similarity of outcome between the active treatments. Since all patients in all groups received the same therapeutic rationale and instructions to practice, it is conceivable that the degree of self-practiced exposure is a major mediating factor in these treatments. If this is truly the case, one would expect to find less practice in the nonspecific group than in the other three treatment groups which, in addition, would not differ significantly in this respect. The authors plan to examine the role of self-directed practice in the various treatments, using continuous naturalistic data collected by means of diaries.

In summary, these preliminary results indicated that imipramine, flooding, and their combination treatment are equally effective in the treatment of agoraphobia, given that rational and basic instructions to practice *in vivo* are present. Clearly, these findings need replication on larger samples. Likewise, the numerous questions raised, relating to both process and long-term outcome, require further elucidation. What seems likely, however, is that self-help groups relying solely on discussion and providing support and information as well as instructions to face phobic situations may be of limited effectiveness in the treatment of chronic agoraphobia.

Comparison of Generalized Anxiety Disorder With Panic Disorder Patients

Rudolf Hoehn-Saric, M.D.[1]

Few attempts were made to distinguish subgroups of patients with the broad diagnosis of "anxiety neurosis" prior to the reclassification of anxiety disorders in the Diagnostic and Statistical Manual-III (DSM-III). The discovery that antidepressants prevent the reoccurrence of panic attacks but do not affect anticipatory anxiety (Klein 1981), led to the division of anxiety neurosis into panic disorder and generalized anxiety disorder. Several studies have investigated panic disorders (Klein et al. 1978; Mountjoy et al. 1977; Sheehan et al. 1980), however, the description of generalized anxiety disorders in DSM-III was based on clinical impression rather than on systematic data. In an earlier study, Hoehn-Saric (1981) reported that generalized anxiety disorder patients differed from those with panic disorders mainly in physical symptoms. Generalized anxiety disorder patients also rated themselves more introverted than those with panic disorder. Recently, a survey which examined symptomatic volunteers found those who were diagnosed as having panic disorder rated themselves higher on the anxiety subscale and the panic anxiety subscale of the Hopkins Symptom Checklist than volunteers who were classified as generalized anxiety disorder (Barrett 1981). This paper presents a more extensive comparison between the two disorders, based on a multi-axial approach, which describes state measures, personality measures, social adjustment, and disturbance during childhood.

Method

Subjects

The population consisted of 133 patients who were admitted to the Anxiety Clinic at the Johns Hopkins Hospital. All patients suffered persistent anxiety for at least 6 months, had no history of psychotic disorder, were not substance abusers, and were sufficiently educated to rate various questionnaires. Criteria for panic disorders followed the guidelines of DSM-III; however, it included patients who experienced panic attacks only once a month. Patients who had experienced panic attacks in the past but, in spite of lack of adequate treatment were free of panic attacks for at least 6 months, were placed in the category of Generalized Anxiety Disorder.

Of the 133 patients examined, 48 percent were diagnosed Generalized Anxiety Disorder and 52 percent Panic Disorder. The average age was 33.9 years, ranging between 18 and 58. Eight-two percent were white and 18 percent black, 60 percent female and 40 percent male, 45 percent were married and the others were single, separated, or divorced. The average education was 13 years, with 8th grade as minimal education. There were no significant differences on any of the demographic data between the two diagnostic conditions.

Measures

At the time of admission to the Anxiety Clinic, patients filled out four types of questionnaires covering present state (symptoms), personality traits, social and personal adjustment, and behavioral disturbances during childhood. The following measures were employed:

---

[1] Johns Hopkins School of Medicine, Baltimore, MD 20205.

State Measures

Physician Ratings. 1) *Hamilton Anxiety Scale* (Hamilton 1959): This scale describes psychic and somatic symptoms associated with anxiety. 2) *Global Rating of Generalized Anxiety:* A 4-point scale describing the general level of anxiety. 3) *Global Rating of Anxiety Attacks:* A 4-point scale describing sudden emergence of anxiety, including panic attacks. 4) *Global Neurotic Scale:* A 4-point scale rating psychic symptoms of anxiety. 5) *Global Somatic Scale:* A 4-point scale rating physical symptoms of anxiety.

Patient Ratings. 1) *State- Trait Anxiety Inventory, State Form* (Spielberger et al. 1970): This form describes the present level of psychic anxiety. 2) *Affects Balance Scale* (Derogatis 1975): A self-rating scale of four positive and four negative affects. 3) *Somatic Symptoms Scale* (Hoehn-Saric 1981): Describes somatic symptoms that frequently accompany anxiety. 4) *Zung Scale of Depression* (Zung 1965): Describes symptoms associated with depression.

Personality Measures

1) *Eysenck Personality Questionnaire Form A* (Eysenck & Eysenck 1975): Measures two personality dimensions: extraversion, which describes the person's sociability and impulsivity, and b) neuroticism, which measures trait anxiety, dysphoria, and lability. 2) *Mastery-Powerlessness Scale* (Frank et al. 1978): This modification of Rotter's Locus of Control Scale (Rotter 1966) rates the person's perception of internal control, i.e., the degree to which he is in control of himself and his environment, as opposed to external control, i.e., seeing himself at the mercy of fate and other forces. 3) *State-Trait Anxiety Inventory, Trait Form* (Spielberger et al. 1970): This scale describes a person's general tendency to respond to anxiety.

Social Adjustment

Clark Personal and Social Adjustment Scale (Clark 1968): This scale appraises the effectiveness and satisfaction at work, interpersonal relationships, feeling of optimism, and feeling of mastery.

Childhood Behavior Disturbance Measure

Childhood History (Tarter et al. 1977): This is a 50-item checklist of behaviors associated with children diagnosed as "minimal brain disorder."

Statistics

Student's *t*-tests were used to compare the differences between scale values in Generalized Anxiety Disorder patients from those of Panic Disorder patients. In addition, discriminant analyses (Wilks) were calculated to identify items differentiating the two disorders.

Results

Table 1 summarizes the differences between the Generalized Anxiety Disorder and Panic Disorder groups. Patients with a Panic Disorder rated significantly higher on the total score of the Hamilton Anxiety Scale ($p < .005$) and, as expected, on the Global Rating of Anxiety Attacks ($p < .001$). The reason that patients diagnosed as Generalized Anxiety Disorder also scored on anxiety attacks was due to the vagueness of the scale which included not only panic attacks, but also strong, rapidly increasing fluctuations of anxiety levels. Ratings on the Zung Scale of Depression and the Global Rating of Generalized Anxiety failed to discriminate between the two groups. Additionally, none of the psychic subscales discriminated significantly between the two groups. However, all of the somatic scales, including the somatic subscale of the Hamilton Anxiety Scale ($p < .001$), the Global Somatic Scale ($p < .003$), and Somatic Symptoms Scale ($p < .05$), differentiated between the two groups. None of the personality measures, the social adjustment ratings, or the Childhood History differed between the two disorders.

Symptoms of the Somatic Symptoms Scale were subdivided into classes describing muscular symptoms, symptoms associated with hyperventilation, cardiovascular symptoms, and gastrointestinal and genital symptoms. Only symptoms

CHILDHOOD DISTURBANCES				
Childhood Scale	107	7.4 ± 6.2	9.1 ± 6.6	-

[a] Number of patients with completed scales

associated with hyperventilation and the cardiovascular system differentiated significantly between the two disorders ($p < .05$ for each symptom subclass). On individual physical symptoms, patients with panic disorder rated significantly higher ($p < .05$ or higher) on the following subscales: fatigue, sweating, heart pounding, difficulty breathing, having a lump in the throat, headaches, attacks of irritability, attacks of depression, and lower degree of vigor.

Table 2 outlines the results of the discriminant analysis. Only patients with complete records were included. The Hamilton Anxiety Scale, which was introduced after collection of half of the population, was excluded from the analysis. Since highly correlated items are automatically eliminated from the discriminant analysis, the state form of the State-Trait Anxiety Scale whi correlated with the Zung Depression Sca ($r = 0.69$, $p < .001$), does not appear on Table The analysis discriminated to a significant deg between the two disorders ($p < .001$). The analy indicated that in addition to physical symptom the lack of positive affects, the presence negative affects, and general "neurotic" symp toms, differentiated between patients with pa disorders and generalized anxiety disorders. discriminant analysis of the subscales of Somatic Symptoms Scale (*see* Table 3) confirm that symptoms associated with the cardiovascu system and hyperventilation also differentia the two groups ($p < .04$). Furthermore, insomn and loss of sex drive were strongly represented the Panic Disorder patients.

Table 2

Generalized Anxiety Disorder vs. Panic Disorder Discriminant Analysis (Wilks) $N = 87$, (GAD:43, PD:44)

Standardized Canonical Discriminant Function Coefficients:	
Zung Depression Scale (PD higher)	1.25
Affects Balance Scale, Total Positive (PD lower)	1.00
Physicians' Ratings of Anxiety Attacks (PD higher)	−0.68
Affects Balance Scale, Total Negative (PD higher)	−0.59
Global Neurotic Symptoms Scale (PD higher)	0.49
STAI, Trait Form (PD higher)	−0.47
Physicians' Ratings of Generalized Depression (PD higher)	0.45
EPI, Extraversion (PD higher)	−0.36
Physicians' Ratings of Irritability Attacks (PD higher)	−0.36
Physicians' Ratings of Generalized Anxiety (PD lower)	0.34
Global Somatic Symptoms Scale (PD higher)	−0.26
Somatic Symptoms Scale, Muscular Symptoms (PD higher)	−0.24
Group Centroids	
Generalized Anxiety Disorder	0.89
Panic Disorder	−0.87

Generalized Anxiety Disorder vs. Panic Disorder Discriminant Analysis of Items of the Somatic Symptoms Scale (Wilks) $N = 124$ (GAD: 60/PD: 64)

Standardized Canonical Discriminant Function Coefficients:[a]	
Tingling in arms and legs	0.57
Difficulties sleeping	0.57
Loss of sex drive	−0.57
Heart pounding or racing	−0.51
Sweating	−0.48
Headaches	−0.43
Group Centroids:	
Generalized Anxiety Disorder	−0.35
Panic Disorder	−0.32

[a] Panic disorder group rating higher on all symptoms

Canonical discriminant function: Wilks lambda 0.90, *df* = 6, sig. = 0.04

Discussion

The study confirmed previous findings that patients with Panic Disorder diagnosis score higher on somatic, but not on psychic anxiety scales than patients with a Generalized Anxiety Disorder diagnosis (Hoehn-Saric 1981). In addition, it was demonstrated that the groups differed predominantly in symptoms describing hyperventilation and cardiovascular changes rather than symptoms relating to the muscular and gastrointestinal systems. The results also showed that Panic Disorder patients tend to experience more negative affects, such as depression and irritability. The extended survey failed to replicate the previous finding that Generalized Anxiety Disorder patients are more introverted (Hoehn-Saric 1981). Moreover, the extraversion dimension of the Eysenck Personality Questionnaire correlated poorly with the other measures ($r = \leq .35$), indicating a weak relationship to psychopathology. The neuroticism dimension of the Eysenck Scale was significantly correlated with all psychic scales, the Zung Depression Scale, and the Somatic Symptoms Scale ($r = .43$ to $.69$, $p < .001$), but failed to differentiate between the two diagnostic groups.

The lack of relationship between the diagnostic categories and personality variables, social state, and childhood history suggests that the primary difference between patients who develop panic attacks and those who experience generalized anxiety may lie in their physical response to stress. However, an examination of the population suggests that patients with the diagnosis of Generalized Anxiety Disorder may form a heterogeneous group. Some patients who had experienced panic attacks in the past changed into having generalized anxiety without further panic attacks, while other patients who had suffered from generalized anxiety for years eventually developed a panic disorder. The latter sequence has also been reported by Cloninger et al. (1981). Moreover, in a previous study, Hoehn-Saric and Masek (1981), discovered a group of patients who corresponded to the description of Generalized Anxiety Disorder except that they lacked autonomic hyperactivity. These patients had a significantly higher degree of forehead muscle tension than normal controls. However, heart rate and skin conductance remained comparable to the control group. A pilot study, which the investigator is conducting at the present time, suggests that within moderate degrees of anxiety, some patients experience pronounced autonomic symptoms such as increased diastolic and systolic blood pressure, while others exhibit pronounced muscular symptoms without excessive cardiovascular changes.

Further investigations will be necessary to determine if patients with a Generalized Anxiety Disorder constitute a continuum whose symptoms relate directly to the severity of anxiety, or if they represent distinct subgroups with different constitutionality, one being autonomically labile and the other autonomically stable. If this should be the case, one would expect that under sufficient stress the autonomically labile group would develop panic attacks, while the autonomically stable group may exhibit various psychic symptoms, insomnia, and somatic symptoms associated with increased muscle tension, but would not develop a panic disorder. A dichotomy of patients diagnosed as Generalized Anxiety Disorder into those with high and low levels of cardiovascular symptoms was not helpful, because patients who scored high on cardiovascular symptoms also rated high on all other psychic and somatic measures. Thus, it appears that patients with high levels of anxiety experience all types of somatic symptoms. This does not exclude the possibility of a distinct subgroup of anxiety disorders which, due to their greater autonomic stability, remain within moderate levels of anxiety ratings. A clarification of the existence of such subgroups will be of importance in the pharmacotherapy of anxiety disorders.

Unresolved Issues in the Treatment of Agoraphobia With Panic Attacks

Michael R. Liebowitz, M.D.,[1] **and Donald F. Klein, M.D.**[1]

There is at present considerable confusion in the treatment for agoraphobia regarding the respective roles of various forms of psychotherapy and medication. A number of self-help phobia groups specifically eschew the use of medication. Even groups (Chambless 1981) who recognize the utility of antidepressant medication first recommend extensive, complex courses of psychotherapeutic treatment and consider medication only if such treatment fails. A literature review to determine the relative utility of pharmacological and behavioral forms of treatment and the specific impact of each upon the various components of the agoraphobic syndrome reveals the need for further comparative trials.

As defined in the Diagnostic and Statistical Manual-III (DSM-III), Panic Disorder is a condition characterized by the sudden and unprovoked occurrence of severe anxiety which can border on terror, and which is usually accompanied by such symptoms as palpitations, breathlessness, sweating, faintness or dizziness, nausea, or diarrhea. The attacks usually last only 20-30 minutes, but become the source of great concern to patients who fear they are going crazy, having a heart attack, or about to lose control of themselves in some socially embarrassing way. What usually follows is the development of great anticipatory anxiety, which is often treated or self-treated with tranquilizers or alcohol. A third stage involves phobic avoidance of places where panic attacks typically occur or where rapid exit to seek help is difficult, such as public transportation, heavy auto traffic, bridges, tunnels, restaurants, theaters, churches, or crowded stores. When a widespread, disabling avoidance pattern becomes established, the patient meets DSM-III criteria for Agoraphobia with Panic Attacks.

Pharmacotherapy

The pharmacotherpay of panic attacks has advanced greatly in the past two decades. Of major importance was the recognition that panic attacks, although not the accompanying anticipatory anxiety, could be effectively blocked by the tricyclic antidepressant imipramine, but not by minor tranquilizers such as the benzodiazepines (Klein & Fink 1962; McNair & Kahn 1981). On the other hand, benzodiazepines but not tricyclics appeared to be effective for the anticipatory anxiety that often develops as a consequence of panic attacks. This led Klein to hypothesize that panic attacks and non-panic anxiety represent two distinct pathophysiological entities. However, a recent report (Lipman et al. 1980) that non-panic chronic anxiety states also respond preferentially to tricyclics over benzodiazepines, and that the benzodiazepine alprazolam may effectively block panic attacks (Sheehan 1982); suggests that further studies are required before firm boundaries between panic anxiety and non-panic anxiety conditions are drawn.

Extending these findings were studies that demonstrated that the monoamine oxidase inhibitors (MAOI) were also highly efficacious for panic attacks (Tyrer et al. 1973). Phenelzine was also shown to block the ability of sodium lactate to precipitate panic attacks in Panic Disorder patients (Kelly et al. 1971), a phenomenon also recently demonstrated for imipramine by the authors' research group. The ability of sodium lactate to induce severe anxiety attacks in patients vulnerable to spontaneous episodes but not in normal controls was first demonstrated by Pitts and McClure (1967) and later replicated by several other investigative groups (Fink et al. 1969) including work done by the authors.

---

[1] College of Physicians and Surgeons, Columbia University and New York State Psychiatric Institute, New York, NY 10032.

A recent double-blind, placbo-controlled study comparing the efficacy of the tricyclic imipramine and the MAOI phenelzine in patients with panic attacks found both drugs to be highly effective with a trend to superiority for phenelzine (Sheehan et al. 1980). One problem that limits the generalizability of these findings is that dosages of both active drugs used in the study were fixed and low, phenelzine being limited to 45 mg/day and imipramine to 150 mg/day, while in the authors' experience some panic patients require phenelzine doses of up to 90 mg/day or imipramine doses of 300 mg/day or more.

Behavior Therapy

Paralleling the progress in clinical psychopharmacology was the recognition that many agoraphobic individuals could be markedly helped by behavior therapy, coupled with a gradual refinement of those techniques. The modern era of behavior therapy of phobias actually dates back to the late 1950s with Wolpe's reports of the use of systematic desensitization, which involved having patients go through an imagined hierarchy of fear-producing situations while practicing deep muscle relaxation (Wolpe 1958). A variant of this technique developed by Stampfl and called imaginal flooding, has patients begin by imagining themselves confronting their most feared situation rather than slowly building up from non-feared situations as Wolpe had them do (Stampfl 1970).

While much debate occurred over the actual therapeutic mechanisms of these behavioral techniques, a central principle of all therapists who treat phobias is that to overcome the fear a patient must actually confront phobically avoided objects or activities. Given this, beha therapists began to wonder if it did not more sense to directly try systematic densensiti tion or flooding in live situations rather than imagination. From this evolved several *in viv* posure techniques (prolonged exposure, cessive approximations, therapist-assiste homework assignments, individual or group) a variety of investigators in short-term stu have found to be more quickly effective than posure in imagination for treating agoraphobic well as simple phobics (Mathews et al. 1981). the studies by Zitrin et al. (1978, 1980) expos *in vivo* was faster-acting but did not improve greater proportion of the patients than o techniques over 26 weeks.

Pharmacotherapy vs. Behavior Therapy

With the emergence and proven efficacy of easily applied treatment techniques, one ph macological and the other behavioral, the n question to be asked was: "How do these forms of treatment compare with each other patients with panic attacks and agoraphobi Recently, several studies have attempted answer this question, but a number of importa issues have not been satisfactorily resolved.

One study by Solyom et al. (1981) compar phenelzine and exposure in a 2 × 2 double-bli design involving 40 patients who were eit agoraphobic or socially phobic. Phenelzine w given for 6 weeks in doses up to 45/mg day, wh exposure appears to have involved therapist structions for patients to confront anxiety-elicit situations bolstered by three telephone calls week to the patient. Patients who did not rece exposure were not "systematically encouraged confront phobic situations."

While the authors concluded that exposu with or without phenelzine, was the supe treatment, there are a number of issues whi limit the generalizability of this conclusion. On that, as acknowledged by the authors, phenel doses of 45 mg or less are below the 60-90 mg le now found effective with depressed patien Secondly, 6 weeks of medication treatment much less than the 26 weeks found optimally fective for agoraphobics in other studies (Soly et al. 1981; Zitrin et al. 1980). Thirdly, social phobics, who have not generally shown to be responsive to antipanic medications, are mixed in with agoraphobics without separate pretreatment stratification or even independent reporting of the results. Also, no mention is made about how many patients in either group had spontaneous panic attacks; while most agoraphobic patients do, this is not always the case. For this reason, DSM-III distinguishes between Agoraphobia with Panic Attacks and Agoraphobia without Panic Attacks. Finally, one might reasonably argue that the investigators in this study are not comparing clinically meaningful modes of treatment. Pharmacologists familiar with treatment of phobias will tell their patients that in addition to taking medication they must push themselves to confront feared situations; where they differ in practice from behavior therapists is by not offering a structured program to bring this about. The clinically relevant comparison is how drugs plus such informal "exposure instructions" compare to formal exposure programs without drugs, and the Solyom study cannot answer this question.

At approximately the same time Zitrin et al. (1980) reported a study of 76 agoraphobic women randomly assigned to imipramine or placebo while all received group *in vivo* exposure for a 10-week period. Medication was started first; from weeks 5-14, patients received one exposure session per week lasting 3 hours. Medication was continued until week 26; the maximum possible dose of imipramine was 300 mg.

This study found imipramine plus exposure superior to placebo plus exposure at both 14 and 26 weeks in terms of clinical global improvment, primary phobia, and spontaneous panic. Interestingly, the active drug group continued to improve between weeks 14 and 26. At 26 weeks the imipramine patients tend to be markedly improved, while more placebo patients tended to register moderate improvements, although some were also markedly improved. (According to the independent evaluator, 62 percent of imipramine patients were markedly improved on clinical global ratings at 26 weeks, while 28 percent were moderately improved and 10 percent showed no or only minimal improvement; for the placebo group, 29 percent were markedly improved, 42 percent moderately better, and 29 percent only minimally better or unimproved.) An interesting finding was that panic attacks increased between weeks 14 and 26 (after discontinuation of exposure) in the placebo but not in the active drug groups. Given these findings, it makes sense that future studies should extend the drug treatment period to 26 weeks, far beyond the usual 6 to 8 weeks. It also makes sense now to try extending the exposure treatment period to 26 weeks as well, since a once-weekly group session for 6 months is not an impractical form of clinical treatment.

While the dropout rate was the same for the two treatment groups (29 percent), eight of twelve active drug dropouts left because of a refusal to take medication, while only one could not keep up with the exposure program. For the placebo group, three of ten refused to continue medication, while five of ten were unable to keep up with the group. Whether dropouts (and nonresponders) unwilling to comply or unable to benefit from one type of treatment would do well with the other is an open question.

At 6 months posttreatment, 27 percent of the imipramine and 6 percent of the placebo group had relapsed. While these differences were not statistically significant, they have been cited by other investigators to show that drug treatment is less durable, even when combined with exposure. However, the data can be looked at another way, namely, that a certain percentage of agoraphobics require continued medication to maintain their gains, and will relapse when medication is withdrawn even after 6 months of treatment.

This study also found that the more depressed patients were at the beginning of treatment, the worse they did, which weighs against Marks' argument that imipramine's effect is confined to agoraphobics with associated depression (Marks et al., unpublished). Zitrin et al. (1978, 1980) believe that the dysphoria often seen in agoraphobics is symptomatic of antidepressant unresponsive demoralization rather than tricyclic responsive endogenous depression, since they found no drug specific antidepressant effect. Scientific progress since the time the Zitrin et als.'s study was begun now allows investigators to also distinguish signs of frequently associated atypical depression (Liebowitz et al. 1981) in agoraphobic or panic patients. On the basis of preliminary evidence, panic patients with associated atypical depressions may not do particularly well on tricyclics (Liebowitz et al. 1982).

Zitrin et al. had earlier reported a 26-week study comparing systematic desensitization plus imipramine, systematic desensitization plus placebo, and supportive psychotherapy plus imipramine in 218 patients (Zitrin et al. 1978). Diagnostically the patients were divided into agoraphobics, simple phobics, and mixed phobics (who had circumscribed phobias, panic attacks, and no travel restrictions). Overall, imipramine was found superior to placebo in the agoraphobic and mixed phobic groups in reducing overall severity of illness, improvement in phobias, reducing severity, and frequency of panic attacks and reducing other anxiety symptoms, while no differences were found between behavioral and supportive psychotherapy for any diagnostic group. In addition, for the agoraphobic group ($N = 77$), behavior therapy plus imipramine was clearly superior to behavior therapy plus placebo in reducing the frequency and severity of anxiety attacks, as measured by the Acute Panic Inventory and the Taylor Manifest Anxiety Scale, for the travel and panic symptom clusters on the Wolpe-Lang Fear Survey Schedule, and for independent evaluators rating of primary phobia improvement.

Marks and colleagues also recently compared imipramine (up to 200 mg/day for 28 weeks), placebo, therapist-aided exposure, and therapist-aided relaxation for 45 agoraphobic patients in a 2 × 2 design (Marks et al., unpublished). All patients were given systematic self-exposure homework including an instruction manual. No significant effects were found for imipramine, while significant but limited effects were found for therapist-aided exposure. Marks et al. concluded that self-exposure homework is a powerful therapeutic device, that imipramine adds nothing for agoraphobics who are not depressed, and that therapist-aided exposure is helpful for some patients.

One limit on the generalizability of Marks' conclusions is low medication dosages; mean doses were 124 mg at Week 6, 158 mg at Week 14, and not reported at Week 26. (Mean drug plasma levels were in the antidepressant range, but inflated by several outliers.) In addition, a number of patients previously shown not to respond to antidepressants were taken into the study. Also, among the patients counted as dropouts were two who showed rapid improvement with imipramine. One other interesting point was that patients were put on imipramine during the ad treatment followup period, including 8 who h been on imipramine before. However, no me tion is made as to whether these individua deteriorated when taken off medication the fir time.

However, comparison of Marks' sample sel ratings of "feeling blue" are almost identical wi the Zitrin-Klein sample; therefore, the differenc in drug effects is unlikely to be due to lesse depression in Marks' sample. Further, Zitrin Klein specifically barred acceptance of any pa tient with diagnosable depression.

Mavissakalian and Michelson (1981) hav recently reported the preliminary results of a ongoing comparison of imipramine, placebo flooding, and nonspecific psychosocial treatmen in agoraphobic patients using a 2 × 2 design. Al patients were given weekly therapeutic instructio on the importance of trying to enter fear situations. Maximum imipramine dose was 200 m and duration of treatment was 12 weeks. The control for *in vivo* exposure was a group discussion o illness and progress. Patients previously treated with antidepressants were not excluded; in fact all 32 patients reported in the pilot study ha previously received antidepressants of some type although drug dosage, duration, and previou response are not indicated. Average dose of imipramine in the last month of treatment was 12 mg/day. A behavioral performance test was used as an outcome measure, as was an overall judgment about degree of improvement.

What is reported are the results obtained at month posttreatment. Both imipramine and exposure were found to be active treatments, with no significant differences between them and no additional benefits seen in the combined group No predictors are offered as to which patients d well with one or another form of treatment, although the investigators speculated that imipramine may stabilize mood (block panic?) which leads to behavioral change, while *in vivo* exposure may produce behavioral and then mood improvement.

Conclusion

What are needed are drug versus exposur studies that exclude patients previously show unresponsive to either test treatment, use of adequate doses and duration of medication, continue exposure treatment for patients who respond, test nonresponders for their responsivity to other forms of treatment, and rigorously evaluate both type and degree of associated depression. Hopefully, this will generate clinical predictors of who responds best to pharmacological or behavioral treatment of agoraphobia. Among the specific hypotheses that require testing are the following:

1. That patients whose panic attacks are in remission or on the wane but who still have high anticipatory anxiety will do well with group *in vivo* exposure without accompanying drug treatment.

2. That patients with severe or frequent ongoing panic attacks will do better with antipanic drug treatment, and may become more phobic or demoralized if treated with an *in vivo* exposure program unaccompanied by drug treatment.

3. That patients with frequent or severe panic and high anticipatory anxiety may require both forms of treatment but will do better if drugs are offered first, to be followed by a formal exposure program once panic attacks are blocked.

4. That some of the agoraphobic patients who improved with exposure, unaccompanied by drug, may overcome their phobic avoidance but still continue to experience panic attacks that they have now learned to tolerate or "float through." This could be assessed by self-report, by *in vivo* physiological monitoring, and by pre- and post-treatment challenges with sodium lactate infusions to test changes in panic vulnerability.

5. That many agoraphobic patients will respond to drug treatment without any concomitant psychotherapy except simple encouragement of self-exposure. This has never been examined in a formal study; previous trials of antidepressant medication in agoraphobics that have employed adequate dosage and duration of treatment have embedded these trials within various forms of psychotherapy. Thus, it remains unclear whether psychotherapy is necessary to help patients reduce anticipatory anxiety and avoidant behavior once panic attacks have been blocked by medication. Clinical anecdotal evidence indicates that many patients can rid themselves completely of the agoraphobc syndrome by simple drug treatment accompanied by encouragement of self-exposure activity (Muskin & Fyer 1981).

6. That depressive features are not necessary for imipramine's anti-panic effects and, in the case of associated atypical depression, may impede it. On the other hand, demoralization may impede self-exposure and extinction of anticipatory anxiety.

7. That imipramine's principal effect in agoraphobia is to block panic attacks, and that the lessening of anticipatory anxiety occurs after the antipanic effects. This could be assessed by having patients keep daily logs and ratings of frequency and intensity of episodes of panic and anticipatory anxiety as well as frequent investigative assessments of both types of symptomatology.

The authors now have in hand two relatively effective modes of treatment for Agoraphobia with Panic Attacks, but further comparative trials are required before they can fully identify the mechanisms by which each works, or say which is preferable as a first try for any particular patient.

Antiobsessional and Antidepressant Effects of Clomipramine in the Treatment of Obsessive-Compulsive Disorder

Thomas R. Insel, M.D.,[1] Ina Alterman, M.A.,[1] and Dennis L. Murphy, M.D.[1]

Two treatments for obsessive-compulsive disorder (OCD) have recently been demonstrated to be effective. A particular form of behavior therapy using exposure and response prevention techniques has prompt and lasting effects for OCD patients who ritualize (Foa & Goldstein 1978; Marks et al. 1980). Pharmacologic treatment, in particular, treatment with clomipramine, has also been shown to be effective, although less information is available about the magnitude and duration of the effects (Insel & Murphy 1981; Thorén et al. 1980). One promising aspect of clomipramine treatment is that patients without rituals or avoidant behavior and patients with secondary depressions, i.e., groups for whom behavioral interventions may be less effective (Foa 1979), may be drug responders. Whether all categories of obsessional patients are likely to respond to clomipramine remains controversial. For instance, Marks (1981) has recently noted, after reviewing several studies, that clomipramine was less effective for nondepressed OCD patients in one study than in comparable studies using somewhat more depressed OCD patients.

The authors attempted to evaluate both antiobsessional and antidepressant effects in an ongoing double-blind study of clomipramine, clorgyline, and placebo for OCD. While much of the data from this study have yet to be analyzed, a preliminary comparison of a few rating scales yielded data pertinent to the following questions: Do baseline depression ratings in OCD patients predict response to clomipramine? Are changes in obsessional and depression rating scale scores correlated during clomipramine treatment? Are the time courses for antiobsessional and antidepressant changes different and, if so, which effect occurs first?

Method

The authors studied 12 OCD patients, fulfilling Diagnostic and Statistical Manual-III (DSM-III) criteria and Research Diagnostic Criteria (RDC) and including both ritualizers and pure obsessionals at the Clinical Center of the National Institutes of Health. The patients (age 19-45, mean 29.9 years) included seven males and five females. The double-blind study involved crossover trials of clorgyline and clomipramine, although only clomipramine results were analyzed for this report (trend effects within the crossover were not significant). Daily clomipramine dosage ranged from 100 to 300 mg (mean 220 mg). The following clinical ratings were scored for this analysis: Hamilton Depression Scale (18 items) (Hamilton 1967); the Comprehensive Psychiatric Rating Scale-Obsessive compulsive (CPRS-OC) subscale, (Thorén et al. 1980); the CPRS-OC subscale modified to include only primary obsessional symptoms (compulsive thoughts, rituals, concentration difficulty, indecision, lassitude); and global assessment scale for depression and obsessions (each requiring a single number rating between 1 (no symptoms) and 15 (maximum symptoms). These ratings were completed at least every 2 weeks and in many cases weekly. Not all patients had the same rater, although each patient had the same rater throughout the study. The authors calculated percent clinical response by comparing scores at the end of 6 weeks on drug with baseline values (i.e., the end of 4 weeks on placebo).

Results

The entire sample improved after 6 weeks of clomipramine treatment with mean percent change from baseline of 32 percent on the modified CPRS-OC subscale, 33 percent on the Global O-C Scale, and 35 percent on the full CPRS-OC subscale. To answer the question of the influence of baseline depression on clomipramine response, the authors separated the group into more depressed or less depressed subgroups, using the mean Hamilton Depression Score of 12.2 as the dividing point. Judged by changes after 6 weeks of treatment in ratings of obsessions (*see* Table), the less depressed group appeared to show a superior response as shown in the Table, although this difference was not statistically significant. The depression changes were actually greater for the less depressed group, reflecting the greater magnitude of percent changes with a lower baseline.

To augment the group data, the authors used an intensive design for the study of a single case who became depressed in the course of the study. This patient's progress (*see* Figure), followed during two successive double-blind trials, of clomipramine, showed a similar change in obsessional ratings, although baseline Hamilton scores were 300 percent higher on the second trial.

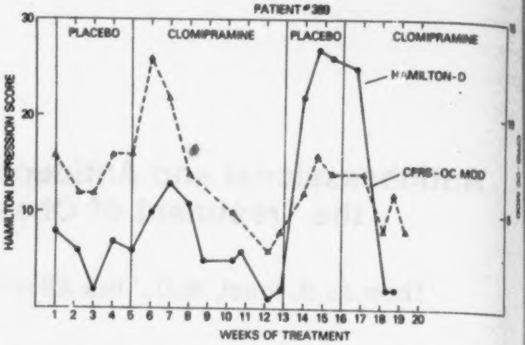

FIGURE. Progress for one subject on two successive double-blind trials of clomipramine.

While it does not appear that response to clomipramine requires or is even favored by high depression scores, is the antiobsessional response correlated with changes in mood? To answer this question the authors compared changes in the global ratings of obsessions and depression following 6 weeks of clomipramine treatment. The correlation for percent change from baseline for these two scales (completed simultaneously by the same rater) was nearly 0 ($r = -.03$), even though the means for percent change for these scales were nearly equal (34.9 ± 7.7 percent for depression, 32.6 ± 4.5 percent for obsessions).

Are the time courses for the two effects different? This question could not be answered comprehensively, as the authors had data at 2-week intervals in six subjects and weekly intervals in the remaining six. Still, the time of the peak change in global ratings of mood and obsessional symptoms could be compared in each subject. For six of the subjects, the peak change in mood was simultaneous with the improvement in obsessional symptoms. For five of the remaining six, the peak mood change preceded the peak change

Table

Baseline Scores and Percent Change on Clomipramine for More-Depressed and Less-Depressed Subgroups of Obsessive-Compulsive Patients

Groups		Baseline			Percent Change at 6 Weeks			
	N	Ham-D Range	Ham-D Mean	MOD CPRS-OC	CPRS-OC	MOD CPRS-OC	Global OC	Global Dep.
More Depressed	5	13-20	15.6	7.6	30.4	24.8	23.7	15.7
Less Depressed	7	7-11	9.7[a]	7.9	39.0	37.7	38.9	48.7[a]

[a] $p < .05$, two-tailed *t*-test for group means.

in obsessional symptoms by 2 to 4 weeks. In one subject, obsessional changes preceded the antidepressant effect. The overall mean for number of weeks to peak change was 3.8 for antidepressant effect and 4.7 for antiobsessional effect.

In summary, the evidence from this trial of clomipramine in OCD patients suggests:
1) Clomipramine's effectiveness for obsessional symptoms is independent of baseline depression ratings;
2) Changes in obsessional symptoms do not uniformly correlate with changes in mood, either in magnitude or time of occurrence;
3) Clomipramine's antiobsessional effects may occur slightly later than its antidepressant effects.

These results are surprising, in view of the accepted nosology that depressive symptoms in OCD are secondary. Indeed, in a separate study using a single dose of *d*-amphetamine, the authors showed a possible correlation between the changes in obsessional and depressive ratings (unpublished data). The lack of such a relationship with clomipramine may reflect the increasing number of confounding variables within a several weeks' trial as opposed to a few hours of treatment in the amphetamine study. Another possibility is that clomipramine, unlike *d*-amphetamine, works through two independent pharmacologic mechanisms to ameliorate a disorder of mood and a disorder of cognition and behavior.

Certainly the distinction between depressive and obsessional symptoms is not always clear. Exhaustion, self-reproach, and preoccupation with guilt are part of both affective and obsessional disorders. While these two disorders have been previously distinguished by different clinical courses (Welner et al. 1975), different rates of suicide (Goodwin et al. 1969), and different family incidences of affective illness (Coryell 1981), individual patients can have both OCD and severe depression. In general, if the depression begins subsequent to the obsessional complaints, it is considered a complication of OCD and, hence, a secondary depression. However, in some cases the depression seems to become autonomous, overtaking the obsessional symptoms.

Furthermore, the authors have reported a higher incidence of some of the psychobiologic manifestations of depressive disorders in OCD patients even without severe or even moderate affective symptoms. These variables include dexamethasone suppression tests (6 or 16 OCD patients escaped) and sleep electroencephalograph (EEG) records (OCD patients show reduced rapid-eye-movement latency and reduced Stage 4 sleep) (Insel et al. 1982). It may be that OCD biologically represents a variant of affective illness which is responsive to antidepressant treatment even in the absence of overt depression. Alternatively, these biological markers may be correlated with some phenomenon that the two syndromes have in common (e.g., anxiety or preoccupation with guilt). A third and not mutually exclusive hypothesis is that OCD is a chronic disorder that predisposes to affective illness, much as an immune deficiency state might predispose to infection. Perhaps the depression brings the patient to treatment, but because of the chronic obsessional disorder the usual affective manifestations are not evident, except as an exacerbation of ruminating or ritualizing. Thus, one would expect the biological manifestations of affective illness and response to antidepressant treatment independent of manifest depression.

Evaluation of Alpha-Adrenergic Responsiveness to Clonidine Challenge and Noradrenergic Metabolism in the Affective Disorders and Their Treatment

Larry J. Siever, M.D.,[1] Thomas W. Uhde, M.D.,[2] Edward K. Silberman, M.D.,[3] Charles R. Lake, M.D.,[4] David C. Jimerson, M.D.,[5] S. Craig Risch, M.D.,[6] Ned H. Kalin, M.D.,[1] and Dennis L. Murphy, M.D.[1]

Introduction

The dysregulation of noradrenergic activity hypothesized to be associated with the affective disorders and the alterations of activity accompanying antidepressant treatment may depend on the functional state of noradrenergic receptors. The physiologic and biochemical responses to the administration of clonidine, a selective α_2-adrenergic agonist, may permit an indirect evaluation of the responsiveness of these receptors. The growth hormone response to clonidine appears to be mediated by postsynaptic α_2-adrenergic receptors in the hypothalamus and in animal studies, its magnitude may be correlated with α^2-adrenergic receptor sensitivity. The hypotensive response may provide a means of assessing the responsiveness of α_2-adrenergic autoreceptors. These and other responses to clonidine, as well as noradrenergic metabolites in controls and depressed patients before and during antidepressant treatment have been evaluated in an attempt to characterize noradrenergic receptor function in depression and its treatment.

Methods

Clonidine was administered to 19 depressed patients (off all medications for 3 weeks) and 20 controls (including 14 age- and sex-matched patient-control pairs) and to 9 patients before and during the administration of clorgyline, a selective monoamine oxidase (MAO)-A inhibitor. All women were tested within the 10 days following menses. Clonidine was administered intravenously over 5 minutes to subjects in the morning following an overnight fast, with plasma samples drawn at 15-minute intervals and blood pressure monitored at 5-minute intervals before and after clonidine administration. The averaged growth hormone response to clonidine during the first hour following clonidine administration was compared between the depressed patients and controls by the Mann-Whitney U Test. The averaged mean arterial pressure (MAP) between 45 and 60 minutes following the infusion was subtracted from the averaged MAP in the 20 minutes prior to the infusion. The magnitude of the MAP decrement after chronic (greater than 21 days) treatment with clorgyline was compared by Student's t-test to the hypotensive decrease before treatment in the nine patients and to the hypotensive decrease after acute (2-3 days) and intermediate (10-14 days) treatment in three of these patients. Noradrenergic availability was indirectly assessed by determining plasma 3-methoxy-4-hydroxyphenylglycol (MHPG) and norepinephrine levels before and during the infusion, as well as urinary metabolite levels excreted over 24 hours prior to the clonidine study.

Table

Percent Fall of MAP Following Clonidine in Patients on Placebo and Long-term Clorgyline

Placebo	Clorgyline
11.7 ± 6.3 (S.D.)	2.4 ± 5.3 (S.D.)

Results

The growth hormone response to clonidine was significantly decreased in all ($p < .001$) subjects compared to controls as well as between age- and sex- matched depressed patients and controls ($p < .05$). This finding held up when subjects with elevated baseline growth hormone levels were either included or excluded. This response was negatively correlated ($r = -0.32, p < .05$, one-tailed test) with baseline plasma MHPG.

The hypotensive response to clonidine was significantly decreased after chronic clorgyline treatment ($p < .05$). No attenuation of the response was observed in the three patients tested after acute clorgyline treatment, with a slight apparent attenuation after intermediate duration treatment. The author's preliminary results do not suggest a consistent enhancement of the growth hormone response to clonidine after chronic clorgyline treatment.

Conclusions

The diminished growth hormone response to clonidine in depression is consistent with the results of other investigators (Checkley et al. 1981; Matussek et al. 1980) and raises the possibility that decreased postsynaptic α_2-adrenergic responsiveness may be associated with depression. Postsynaptic noradrenergic subsensitivity could conceivably contribute to a functional decrease in noradrenergic activity in depressed patients. The degree to which noradrenergic receptor responsiveness may be reciprocally related to presynaptic noradrenergic availability in depression deserves further exploration.

The attenuated hypotensive response to clonidine following chronic MAO inhibitor treatment is consistent with reports of a decreased hypotensive fall following chronic administration of the tricyclic desipramine (Charney et al. 1981; Checkley et al. 1981) and a previous report of patients on clorgyline and imipramine (Siever et al. 1981) and suggests that α_2-adrenergic autoreceptors may become subsensitive decreasing feedback inhibition of noradrenergic release, after chronic antidepressant treatment. The apparent lack of effect of acute treatment in our study suggests that this reflects a slow adaptive change rather than an acute effect such as α_2-adrenergic blockade. The time course of the decreased response to clonidine parallels that of the onset of clinical efficacy and of the decrease in blood pressure accompanying MAO inhibitor treatment, thus suggesting an important role for this adaptation in the MAO inhibitors and perhaps tricyclics' mechanism of action.

Biological Markers for Depressive Illness

Alan G. Robertson, M.D.,[1] Betty Jo Tricou, M.D.,[1] Victor S. Fang, Ph.D.,[1,2] and Herbert Y. Meltzer, M.D.[1]

Introduction

Numerous investigators have reported a blunted thyroid stimulating hormone (TSH) response to thyrotropin-releasing hormone (TRH) in major depression (Extein et al. 1981; Gold et al. 1981; Kirstein et al. 1981).

There is evidence for the regulation of the hypothalamic-pituitary-thyroid axis by serotonergic neurons (Morley et al. 1981). Meltzer et al. (1981) reported a significant decrease in the number of serotonin (5-HT) uptake sites (V_{max}) in the blood platelets of unmedicated depressed patients.

This study investigated the TSH response to TRH and its relationship to ^{14}C-5-HT uptake in patients with major depressive illness, other psychiatric disorders, and controls.

Method

The subjects in these studies were newly admitted psychiatric patients and normal controls. Diagnoses were established according to Research Diagnostic Criteria (RDC).

The TRH test was carried out in 58 euthyroid patients and 19 euthyroid controls. All patients were drug-free for at least 7 days prior to testing and none had a history of lithium carbonate use within the preceding 6 months. After three baseline samples were obtained (-30′, -15′, 0′), 500 μg of TRH was infused at 10 a.m. over a 30-second period with subsequent blood samples taken at 15, 30, 60, 90, and 120 minutes. TSH was determined in duplicate by radioimmunoassay. Maximal TSH response (peak minus t_o baseline) was determined for each subject. The TSH response to TRH was considered blunted for all subjects with $\Delta TSH \leq 7$ μU/ml and in a separate statistical analysis for all subjects with $\Delta TSH < 5.0$μU/ml.

The method of 5-HT uptake determination has been previously reported (Arora & Meltzer 1981). V_{max} and K_m were determined on two occasions in patients who had been drug-free for at least 7 days. Results were averaged.

Table 1

Comparison of Mean ΔTSH Following TRH in Unipolar Depression, Other Diagnostic Groups, and Controls

Diagnosis	*N*	ΔTSH[a]	*t*
Males and Females			
Unipolar depression	12	6.8 ± 4.2	–
Bipolar depression	6	11.8 ± 4.7	2.28[b]
Schizoaffective depression	13	13.5 ± 9.7	2.20[b]
Bipolar, minor, and schizoaffective depression	23	12.8 ± 7.9	2.43[b]
All diagnoses other than unipolar depression	46	12.0 ± 7.3	2.63[b]
Controls	13	11.6 ± 7.2	2.00[c]
Males			
Unipolar depression	8	4.6 ± 2.8	–
Bipolar, minor, and schizoaffective depression	9	8.8 ± 4.8	2.22[b]
All diagnoses other than unipolar depression	22	10.6 ± 5.6	2.80[b]
Controls	8	10.8 ± 7.2	2.24[b]

[a] μU/ml (Mean ± S.D.)
[b] Compared to unipolar depression, $p < .05$.
[c] Compared to unipolar depression, $p < .10$.

Results

Of 19 nonpatient controls given TRH, 500 μg, i.v., six had a personal history of previous minor depression, excess alcohol use, or a family history of treated depressive disorders. Five of these six controls had a blunted TSH response ($\Delta TSH < 5$ μU/ml), whereas none of the other 13 did.

The proportion of patients and controls with a blunted TSH response varied greatly depending upon which criterion ($\Delta TSH < 5$ or $\Delta TSH \leq 7$ μU/ml) was used because the response of many subjects fell within the 5-7 μU/ml range. Eight of 12 (66.7%) unipolar depressed patients had a significantly ($p < .05$) greater proportion of blunted responses (ΔTSH ≤ 7 μU/ml) than the combined group of bipolar, minor, and schizoaffective depressed patients (6/23, 26.1%). Fifteen of 46 (32.6%) patients with other psychiatric disorders (schizophrenia, mania, schizoaffective mania, unspecified functional psychosis, personality disorder, generalized anxiety disorder, obsessive compulsive disorder, anorexia nervosa, and drug use disorder) also had a blunted TSH response. The sensitivity of the TRH test for unipolar depression (primary and secondary) was 66.7 percent and the specificity 67.4 percent, using ΔTSH ≤ 7 μU/ml as the criterion.

[2] Department of Medicine, University of Chicago Pritzker School of Medicine, and the Illinois State Psychiatric Institute, Chicago, IL 60612.

The unipolar depressives had a significantly lower mean ΔTSH response than the 1) bipolar depressives, 2) schizoaffective depressives, 3) bipolar, minor, and schizoaffective depressives, and 4) patients with diagnoses other than unipolar depression (Table 1). Male unipolar depressives had a significantly lower mean ΔTSH response than male controls (Table 1). Secondary major depressives ($N=5$) had a significantly ($p < .05$) lower mean ΔTSH response than patients with primary major depression ($N=7$). There was no significant correlation between the severity of depression as measured by Hamilton scores and the ΔTSH response to TRH.

Peak TSH levels after TRH infusion were reassayed in duplicate by the thyroid laboratory of the University of Chicago Medical Center in 22 patients and controls. Although there was good correlation between both assays ($r=0.953$), the absolute levels differed by 1.5-2 μU/ml in the critical 5-7 μU/ml range.

Table 2

Relationship of TSH Response to TRH and ^{14}C-5-HT Uptake in Major Depressed and Schizoaffective Depressed, Mainly Affected Patients

		Mean ± S.D.	
	N	K_m[a]	V_{max}[b]
Patients	20	0.43 ± 0.16[e]	10.94 ± 3.10[c]
ΔTSH ≤ 7 μU/ml	11	0.37 ± 0.12[d,e]	10.16 ± 2.60[c]
ΔTSH > 7 μU/ml	9	0.52 ± 0.16	11.88 ± 3.54
Controls	55	0.51 ± 0.14	12.74 ± 3.08

[a] K_m indicates the apparent Michaelis constant; the values are micromolar.
[b] V_{max} indicates maximum velocity; the values are picomoles per 10^7 platelets per minute.
[c] $p < .05$ compared to controls.
[d] $p < .05$ compared to patient group ΔTSH > 7 μU/ml.
[e] $p < .005$ compared to controls.

Results of the TSH response to TRH and platelet 5-HT uptake were available for 20 patients with major depression or schizoaffective depression, mainly affective type (Table 2). V_{max} of 5-HT uptake was significantly decreased in patients with a ΔTSH response of ≤ 7 μU/ml compared to normal controls. K_m of 5-HT uptake was significantly lower in patients with a ΔTSH response of ≤ 7 μU/ml compared to patients with a ΔTSH response of > 7 μU/ml and to normal controls.

Discussion

The sensitivity (66.7%) of a blunted TSH response to TRH to identify unipolar depression using a criterion of ΔTSH ≤ 7 μU/ml was in the range as previously reported by Extein et al. (1981), Gold et al. (1981), and Kirstein et al. (1981) who found the TSH response to TRH was useful in confirming the diagnosis of major unipolar depression. The finding of a lower specificity (67.4%) may be due to differences in studies in the diagnostic compositions of patient groups with diagnoses other than unipolar depression.

The finding of a significantly lower mean ΔTSH response in unipolar depression compared to bipolar depression has been previously reported by Gold et al. (1980), but was not confirmed by Bjørum and Kirkegaard (1979). The finding of a significantly lower mean ΔTSH response in secondary major depression compared to primary major depression is opposite to the results reported by Gold et al. (1980).

Finding blunted TSH responses in five of six volunteers with previous minor depression, excess alcohol use, or family history of treated depression indicates the need for careful evaluation of control subjects and their families. This study also indicates the need for an extremely reliable and reproducible means of TSH determination and for each laboratory to determine the limit of the normal TSH response to TRH.

Decreased V_{max} of platelet 5-HT uptake appears to have great promise as a marker of vulnerability to major depressive illness (Meltzer et al. 1981). The association between a blunted TSH response to TRH and decreased V_{max} and K_m values provides some clue to the nature of a blunted TSH response which may be related to an abnormality of the serotonergic system.

Relationship of Dexamethasone (2 mg) and Plasma Cortisol Hypersecretion in Depressive Illness: Clinical and Neuroendocrine Parameters

Gregory M. Asnis, M.D.,[1] Uriel Halbreich, M.D.,[2] Edward J. Sachar, M.D.,[1] R. Swami Nathan, M.D.,[3] Mark Davies, M.P.H.,[1] Hana Novacenko, M.S.,[1] Lynn C. Ostrow, R.N., M.A.,[1] Jean Endicott, Ph.D.,[1] and Joaquim Puig-Antich, M.D.[1]

Dexamethasone (2 mg) resistance and cortisol hypersecretion are two neuroendocrine abnormalities seen in approximately 1/3 to 1/2 of endogenously depressed patients (Brown et al. 1979; Carroll et al. 1976a, 1976b; Sachar et al. 1970; Stokes et al. 1975). Both neuroendocrine disturbances are presumed to reflect increased hypothalamic-pituitary-adrenal activity. The investigators studied the above neuroendocrine assessments in the same group of endogenously depressed patients. The focus was upon the relationship of various clinical correlates with dexamethasone resistance and plasma cortisol hypersecretion; the main hypthesis was that if both tests of cortisol abnormality were associated with specific depressive symptoms, then they were more likely to reflect similar underlying mechanisms.

Method

Thirty depressed patients (10 men and 20 women, mean age ± SD = 44.2 ± 14.4 years, range = 18-64 years) were admitted to an inpatient research ward where they were evaluated with the Schedule for Affective Disorders and Schizophrenia (SADS) (Endicott & Spitzer 1978), and were diagnosed according to the Research Diagnostic Criteria (RDC) (Spitzer et al. 1978) as having a major depressive disorder, endogenous subtype; patients had to have at least a moderately severe depression (Hamilton ≥ 18) (Endicott, et al. 1981). All subjects were free of psychotropic medication for a minimum of 10 days prior to being studied, were medically healthy, and were not taking any hormone pills.

[2] Present Address: Montefiore Hospital and Medical Center, Bronx, NY 10467.

[3] Western Psychiatric Institute and Clinic, Pittsburgh, PA 15261.

Demographic data, RDC depressive subtypes, SADS-C scales (symptom clusters relating to the past week), and a scale constructed by the authors of "Hypothalamic Signs" (insomnia, poor appetite, psychomotor retardation, worsening of mood in the morning) were systematically obtained on all subjects.

All subjects received the 2 mg dexamethasone suppression test (DST)* and a mean 1 to 4 p.m. plasma cortisol assessment. Two mg of dexamethasone were taken orally at 11 p.m. with postdexamethasone plasma cortisol assessed at 4 and 11 p.m. the following day. Resistance to dexamethasone was defined as a postdexamethasone plasma cortisol value of > 5 μg/dl. Plasma cortisol was analyzed by a modified competitive protein binding method as described by Novacenko et al. (1980). Subjects received a basal plasma cortisol assessment prior to the DST. An angiocatheter was inserted in the antecubital vein at 9 a.m. with blood sampling (3 cc) every 30 minutes for 24 hours; 26 or the 30 subjects had a complete study while 4 subjects had their study terminated prematurely (but after 4 p.m.) due to subcutaneous infiltration of the angiocatheter. Thus, all subjects had a 1 to 4 p.m. study, and the mean plasma cortisol for this period was used as an integrated measure of plasma cortisol secretion. This was done because the mean 1 to 4 p.m. plasma cortisol has been shown to highly correlate with the mean 24-hour cortisol in normals and depressives (Halbreich et al. 1981, 1982). In the 26 subjects who had a complete 24-hour study, the mean 1 to 4 p.m. plasma cortisol was also highly correlated to the mean 24-hour plasma cortisol, $r = 90$, $p < 0.001$.

A more extensive evaluation of the mean 1 to 4 p.m. plasma cortisol was undertaken in 32 normal volunteers and 52 endogenously depressed patients in order to determine a satisfactory cortisol level to define cortisol hypersecretion (*see* Figure 1). A mean 1 to 4 p.m. plasma cortisol of > 10 μg/dl was used to define cortisol hypersecretion. This criterion was met in 2 of 32 normals (6 percent) and 20 of 52 (40 percent) depressives (Fisher Exact Probability Test, $p = 0.027$).

Results

Eight of 30 (27%) patients were dexamethasoneresistant and 12 of 30 (40%) patients were defined as cortisol hypersecretors.

Age

Patients with dexamethasone resistance were not significantly different in age from suppressors (45.0 SD 14.2 years vs. 42.2 SD 15.8 years, $F = 0.02$, NS); however, cortisol hypersecretors were significantly older than cortisol normosecretors (51.7 SD 12.7 years vs. 39.3 SD 13.7 years, $F = 6.25$, $p < .02$). A positive relationship between age and cortisol hypersecretion in endogenous depressives had been reported previously by Asnis et al. (1981). Subsequent analyses reported below controlled for age.

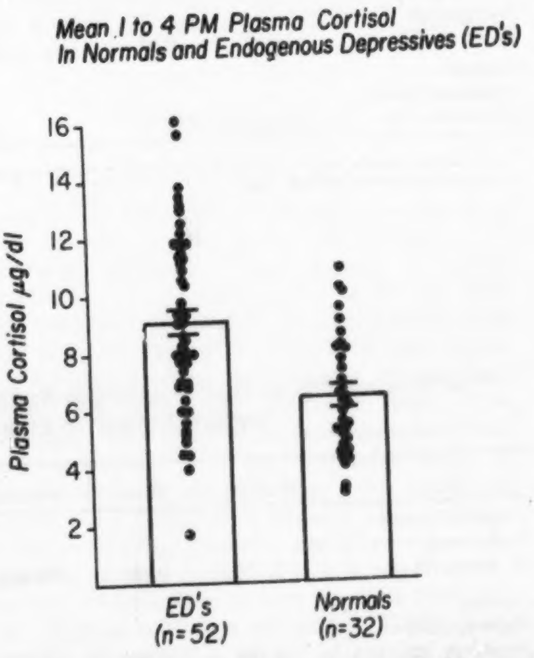

FIGURE 1. Mean 1 to 4 p.m. plasma cortisol in normals and endogenous depessions (EDs).

---

*There are two versions of the DST: one uses 1 mg, the other uses 2 mg.

Sex

Two of 10(20%) men vs. 6 of 20(30%) women were dexamethasone resistant (Fisher exact test, NS); 4 of 10 (40%) men vs. 8 of 20 (27%) women were cortisol hypersecretors (Fisher exact test, NS).

SADS-C Scales

As can be seen in Table 1, the patients wit dexamethasone resistance had significantly highe scores on the scale "Hypothalamic Signs"; the symptom of this scale which was significantl associated with dexamethasone resistance wa

Table 1

The Relationship of SADS-C and Summary Scales to Dexamethasone Resistance and Cortisol Hypersecretion in Endogenously Depressed Patients

	Depressive Syndrome	Endogenous Features	Manic Syndrome	Anxiety	Delusions-Hallucinations Disorganization	GAS Score
Dexamethasone Resistance ($N = 8$ vs. 22)	4.01	3.90	2.76	0.09	0.01	0.08
Cortisol Hypersecretion ($N = 12$ vs. 18)	0.47	0.02	2.86	1.26	0.69	0.12

	Extracted Hamilton	Miscellaneous Psychopathology	Social Functioning	Suicidal Behavior	Hypothalamic[a] Signs
Dexamethasone Resistance ($N = 8$ vs. 22)	0.66	2.49	0.92	0.09	7.20[b]
Cortisol Hypersecretion ($N = 12$ vs. 18)	0.03	4.51[c]	0.98	0.01	0.03

[a] Hypothalamic signs consist of a cluster of symptoms from endogenous feature scale (insomnia, poor appetite, psychomotor retardation, worse in morning) felt be specific for hypothalamic dysfunction.

[b] $p < .01$

[c] $p < .05$

Table 2

The Relationship of RDC Depressive Subtypes to Dexamethasone Resistance and Cortisol Hypersecretion in Endogenously Depressed Patients

	Psychotic	Bipolar	Retarded	Agitated	Simple	Situational	Primary	Incapacitat
Dexamethasone Resistance ($N = 8$ vs. 22)	0.175	0.056	[a]0.018	0.574	0.637	0.426	0.548	0.282
Cortisol Hypersecretion ($N = 12$ vs. 18)	0.455	0.350	0.132	0.251	0.197	0.206	0.350	0.586

[a] Statistically significant

psychomotor retardation ($F = 10.12$, $p < .004$). In contrast, patients with cortisol hypersecretion had significantly higher scores on the scale Miscellaneous Psychopathology (the significant symptom in this scale was subjective anger) ($F = 10.83$, $p < .003$).

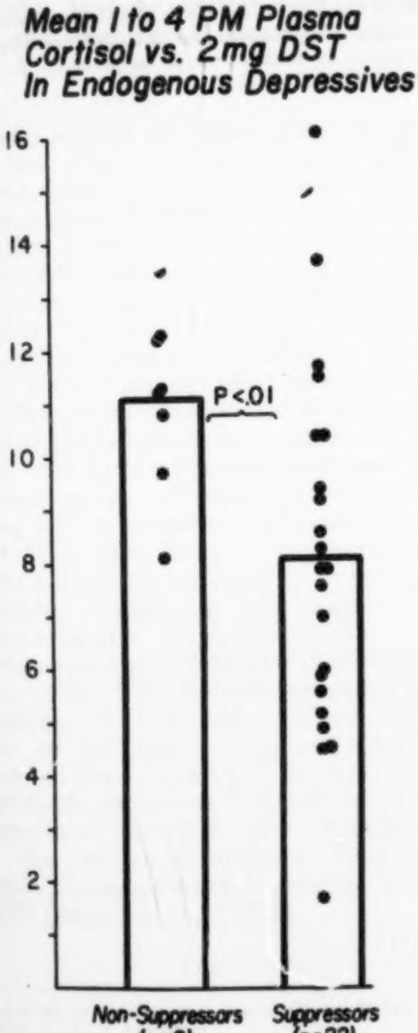

FIGURE 2. Mean 1 to 4 p.m. plasma cortisol vs. 2 mg DST in endogenous depressives.

RDC Subtypes

As can be seen in Table 2, dexamethasone resistance was significantly associated with retarded depression (trend for bipolar depression) while cortisol hypersecretion was not significantly associated with any depressive subtype.

The Association of the 2 Mg DST and Mean 1 to 4 P.M. Plasma Cortisol

As can be seen in Figure 2, nonsuppressors had a significantly higher mean 1 to 4 p.m. plasma cortisol (11.1 ± 1.6 μg/dl) than the suppressors (8.1 ± 3.4 μg/dl) ($F = 8.24$, $p < .01$). Six of 8 nonsuppressors were cortisol hypersecretors in comparison to 6 of 22 suppressors (Fisher exact test, $p = .027$). Although there is an association of the 2 mg DST and plasma cortisol hypersecretion, only 50 percent of the cortisol hypersecretors (6 of 12 patients) were identified by the 2 mg DST. On the other hand, two dexamethasone nonsuppressors were normosecreters.

Within the 12 cortisol hypersecretors, mean 1-4 p.m. cortisol did not predict DST−2 mg. nonsuppression ($r = -.14$, NS).

Discussion

The phenomenon of dexamethasone resistance (2 mg DST) and plasma cortisol hypersecretion were studied in the same 30 endogenously depressed patients. The clinical correlates associated with dexamethasone resistance were RDC subtype (retarded depression) and the summary scale of "Hypothalamic Signs" (the significant symptom being psychomotor retardation). These correlates were different from those associated with plasma cortisol hypersecretion, i.e., older age and the summary scale of Miscellaneous Psychopathology (the significant symptom was subjective anger). These clinical correlates need replication and may reflect the particular sample studied. Thus, a larger sample size may be necessary to firm up these findings.

In addition with two exceptions, DST−2 mg basically identified a subset of cortisol hypersecretors, although the mean 1-4 p.m. plasma cortisol within the group of hypersecretors did not predict DST−2 mg resistance. Dexamethasone

(2 mg) does not simply inhibit "milder" cortisol hypersecretors. Even some normosecretors may escape the suppressant effect of DST–2 mg.

The implication of these clinical/neuroendocrine findings is that the complexity of dysregulation of cortisol secretion in major depressives is not fully understood. Interestingly, both measures of cortisol secretion are associated with depressive illness, but the data reported here do not in any way fit a linear univariate model nor do they identify underlying mechanisms for DST– 2 mg and cortisol hypersecretion.

Several measures (DST–1 mg, *d*-amphetamine test) of cortisol secretion in the same sample of depressives and both normal and pathological controls should illuminate further the pathophysiology of depressive illness and the diagnostic utility of one (or several) tests of cortisol secretion.

Melatonin Secretion as a Neurobiological "Marker" and Effects of Light in Humans

Alfred J. Lewy, M.D.,[1] Thomas A. Wehr, M.D.,[2] Norman E. Rosenthal, M.D.,[2] John I. Nurnberger, M.D.,[2] Larry J. Siever, M.D.,[2] Thomas W. Uhde, M.D.,[2] David A. Newsome, M.D.[3] Leslie E. Becker, M.D.,[2] Sanford P. Markey, Ph.D.,[2] Irwin J. Kopin, M.D.,[2] and Frederick K. Goodwin, M.D.[2]

Development of the highly accurate and sensitive gas chromatographic-negative chemical ionization mass spectrometric assay for plasma melatonin (Lewy & Markey 1978) has facilitated evaluation of pineal function in humans. The pineal gland synthesizes and secretes melatonin in response to stimulation of its beta-adrenergic receptors by norepinephrine released by postganglionic sympathetic neurons, the nervi conarii (Ariëns Kappers 1960; Deguchi & Axelrod 1972). Beta-adrenergic stimulation initiates a sequence of biochemical events, culminating in increased activity of N-acetyltransferase, which converts serotonin to N-acetylserotonin, the rate-limiting step in melatonin synthesis (Klein & Weller 1970). The firing of these sympathetic neurons is discretely regulated by an endogenous pacemaker, thought to be located in the suprachiasmatic nucleus (SCN) of the hypothalamus (Moore & Eichler 1972; Stephan & Zucker 1972). The endogenous pacemaker is responsible for a circadian (about 24-hour) rhythm in the activity of these sympathetic neurons. The circadian rhythm in the hypothalamic pacemaker is synchronized to the environmental light/dark cycle, through input from the retinohypothalamic tract which transmits photic information from the retina to the SCN (Moore & Lenn 1972).

There are essentially two effects of light on the circadian system, one, the light/dark cycle entrains (synchronizes) circadian rhythms (Aschoff 1981) and two, the changing length of darkness throughout the year cues seasonal rhythms (Pittendrigh 1981). An additional unique effect of light (specific to the pineal) is that acute exposure to light suppresses melatonin production (Minneman et al. 1974). It is assumed that all three effects of light are mediated by the same neural pathways. Consequently, measurement of light suppression of melatonin may be a "marker" for the effects of light on the circadian system.

The human pineal appears to be regulated in the same way as is the pineal of other mammalian species, because nighttime secretion of melatonin is suppressed by bright artificial light and sunlight in humans (Lewy et al. 1980). Light also appears to be important for the proper synchronization of the circadian rhythm of melatonin secretion, because some blind people have unusual circadian secretory rhythms (Lewy & Newsome 1982).

Manic-depressive patients seem to be supersensitive to light (Lewy et al. 1981). Four patients (taking no medications in seven out of eight instances) were studied in both mood states. Exposure to 500 lux Vita-Lite suppressed the patients by 50 percent; this intensity had little or no effect in a normal control group ($N = 6$). This difference was statistically significantly different ($p < .02$, by analysis of variance). An additional group of five euthymic manic-depressive patients were also studied. Melatonin secretion was suppressed by 50 percent with 500 lux light in this group as well. Thus, supersensitivity to light may be a "trait marker" for manic-depressive illness. Supersensitivity to light is consistent with, and could possibly explain, phase-advanced circadian rhythms observed in these patients (Wehr & Goodwin 1981). More subjects, including a group of unipolar patients, are currently being studied. Also, preliminary evidence suggests that there may be a seasonal rhythm in light sensitivity in both patients and normal controls, because subjects appear to suppress more during the winter than during the summer.

Light supression of melatonin secretion has some potentially important implications—the circadian rhythms of humans may be synchronized by the light/dark cycle and humans may have seasonal rhythms that are affected by the changing length of daylight Ordinary artificial light apparently does not affect human melatonin secretion (Lewy et al. 1980), implying that human circadian and seasonal rhythms may not be perturbed by indoor lighting under usual circumstances. Consequently, humans may be similar to other species in that they may be affected by the 24-hour rhythm of sunlight and by the length of natural daylight as it changes throughout the year (Aschoff 1981).

Photoperiodic effects of light were evaluated in humans by exposing a man with winter depression to "long days" of light during the winter of 1980 (Lewy et al. 1982a). A manic-depressive patient with a well-documented 13-year history of winter depressions and springtime remissions was exposed to 2000 lux Vita-Lite between 6 and 9 a.m. and between 4 and 7 p.m. for 10 days. Within 4 days his winter depression remitted. Although this is an $N = 1$ study, it is the first attempt to use light to treat a manic-depressive patient with a disorder that appears to be related to the circadian system. More patients were studied during the winter of 1981 using a modified crossover design with dim light as a placebo control. (Ordinary dim room light would not be expected to directly affect the circadian system of humans.) Bright light combined with sleep deprivation as a treatment for depression is also being evaluated.

Melatonin levels are also a marker for adrenergic function. Human melatonin secretion appears to be regulated by beta-adrenergic receptors. Transection of the spinal cord abolishes the circadian melatonin secretory rhythm (Kneisley et al. 1978). Sympatholytic diseases, such as Shy Drager Syndrome and idiopathic orthostatic hypotension, result in either reduced plasma melatonin and urinary 6-hydroxymelatonin levels or disrupted secretory rhythms Tetsuo et al. 1981; Vaughan et al. 1979). Administration of propranolol reduces the nighttime rise in melatonin levels (Hanssen 1977; Vaughan 1976). Bedtime administration of 120 mg daily (p.o.), can completely reduce nighttime melatonin levels (authors' unpublished data).

Clonidine can also reduce nighttime levels (Lewy et al. 1982b). Clonidine was administered intraventricularly (i.v.) to four normal volunteers around midnight at doses of 2.0, 2.5, and 3.0 μg/kg. There was a linear log dose reduction of plasma melatonin levels 1 hour after administration of clonidine compared to the same time on a baseline night ($r = -.986$, $p < .01$). Oral administration of clonidine is also effective; administration by this route has a delayed onset of action and a longer duration of action than after i.v. administration. Measurement of urinary 6-hydroxymelatonin may also be a useful way of quantifying the effects of clonidine on melatonin production. Presumably, clonidine acts on an alpha-adrenergic receptor, although the exact location of this receptor has yet to be identified. [The only alpha-receptor localized so far in the retino-hypothalamic-pineal system has been a presynaptic alpha-2-autoadrenoceptor on the sympathetic neuron innervating the pineal (Pelayo et al. 1977).]

Summary

Plasma melatonin levels are a marker for adrenergic function; the rhythm of melatonin production is a marker for the phase and period of its endogenous pacemaker; suppression of melatonin secretion by light is a marker for the effects of light in humans. Bright light appears to have similar biological effects in humans as does ordinary room light in other species. Light suppression of melatonin may prove to be a valuable research tool; light may also have potential as a therapeutic modality for certain circadian and seasonal disorders.

The Relationship of Plasma-Free MHPG to Anxiety and Psychophysical Pain in Normal Volunteers

Thomas W. Uhde, M.D.,[1] Larry J. Siever, M.D.,[2] Robert M. Post, M.D.,[1] David C. Jimerson, M.D.,[3] Jean-Philippe Boulenger, M.D.,[1] and Monte S. Buchsbaum, M.D.[1]

Alterations in noradrenergic function have been postulated in theories of anxiety and pain. In animals, lesions of the noradrenergic nucleus locus coeruleus produce decreased fear-associated behaviors (Redmond & Huang 1979) and analgesia (Bodnar et al. 1978). Pharmacologic inhibition of the locus coeruleus also produces effects in a similar direction. That is, morphine (Korf et al. 1974) and clonidine (Aghajanian 1978) inhibit locus coeruleus activity, reduce fear-associated behaviors (Redmond 1977; Redmond & Huang 1979), and have potent analgesic (Fielding et al. 1981; Paalzow 1974) properties. Tricyclic antidepressants decrease locus coeruleus firing (Redmond 1977; Redmond & Huang 1979), produce analgesia in some animals, and potentiate morphine-induced antinociception (Malseed & Goldstein 1979). Although electrical and pharmacologic (Redmond 1977; Redmond & Huang 1979) activation of the locus coeruleus is associated with increased fear-associated behaviors, the effect of increased noradrenergic function on antinociception remains uncertain (Pert 1980). These observations may suggest a linkage between the biological functions of anxiety and pain. It is interesting in this regard that morphine is generally accepted to have analgesic and antianxiety properties in man. Furthermore, tricyclic antidepressants are effective in the treatment of patients with panic disorder (Klein 1964)

and certain pain syndromes (Merskey & Hestes 1972). Clonidine also has antianxiety effects in depressed (Uhde et al. 1981) and anxious patients (Hoehn-Saric et al. 1981; Liebowitz et al. 1981; Uhde et al. 1982), but not normal volunteers (Leckman et al. 1980; Uhde et al. 1981, 1982). Although clonidine at low doses does not produce analgesic effects in human controls as a group (Uhde et al. 1980, 1982), both clonidine and morphine produce predictable changes in a subgroup of insensitive subjects in the direction of increased analgesia as reflected by somatosensory evoked potentials (Buchsbaum et al. 1982). Benzodiazepines, which decrease locus coeruleus firing (Grant et al. 1980), recently have been reported to influence endogenous opioid systems (Duka et al. 1979; Soubrie et al. 1980).

Together, these data may suggest a functional relationship between the noradrenergic system and the experience of anxiety and pain. In attempts to collect data pertinent to these variables the authors have investigated the relationship among plasma free 3-methoxy-4-hydroxyphenylethylene glycol (MHPG), state anxiety, and psychophysical pain in 12 normal volunteers.

Method

Psychophysical Pain

Using previously described methods (Davis et al. 1978), an index of pain insensitivity was obtained in 12 normal volunteers 1-1½ hours after the blind administration of a placebo infusion which had been randomly paired with an active medication. Subjects received shocks at each milliamperage (mA) increment from 1 to 31, for a total of 93 randomly presented shocks. Subjects judged each shock as noticeable, distinct, unpleasant, or very unpleasant. An index of pain insensitivity was obtained by threshold and signal detection analysis. This index is derived from the subject's ability to distinguish between distinct and unpleasant sensations. Increases in this measure have been associated with morphine and aspirin analgesia (Buchsbaum & Davis 1979; Davis et al. 1980), and decreases with naltrexone-induced hyperalgesia in schizophrenics (Davis et al. 1979).

State Anxiety

The Spielberger State Trait Anxiety Invento (range 20-80) was administered 1-1½ hours af the placebo infusion (just prior to the administ tion of the shocks).

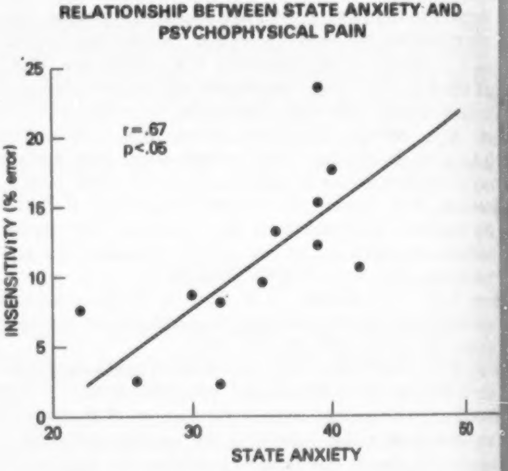

FIGURE 1. Those normal volunteers with higher rati of state anxiety demonstrated increased pain insensitiv as measured by threshold and signal detection analysi

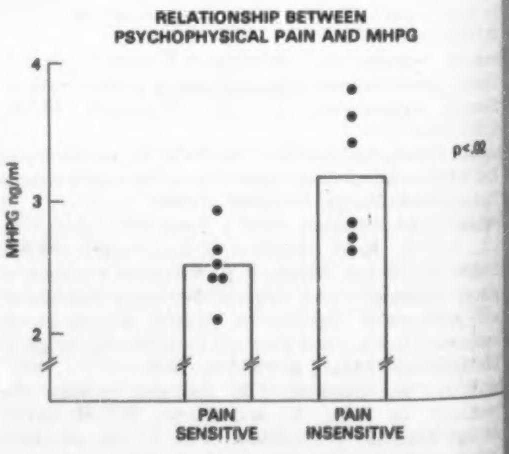

FIGURE 2. In the first 12 normal subjects studied, th most pain-sensitive subjects had lower values of plas free MHPG than the six most pain-insensitive subje

ological Measures

Plasma-free MHPG was measured by gas romatography-mass spectrometry (Jimerson et . 1981). All results refer to data obtained after e placebo infusion and, therefore, just prior to e administration of shocks.

Results

There were significant correlations between ate anxiety and scores on the insensitivity index $= .67, N = 12, p < .05$) (Figure 1) and state nxiety and plasma-free MHPG ($r = .59, N = 12$, $< .05$). Thus, the subjects with the highest tings of state anxiety had the greatest plasma-ee MHPG and were least able to discriminate etween distinct and unpleasant sensations. By edian split, the six most pain insensitive in-ividuals had significantly higher levels of lasma-free MHPG (3.2 ng/ml ± 0.2 S.E.) Figure 2) and anxiety (39.1 ± 1.8) compared to e six least pain insensitive individuals (MHPG .5 ± 0.1, $p < .02$; anxiety 27.8 ± 1.6, $p <$ 001).

Discussion

Our data suggest that the greater the state anx-ety, the greater the insensitivity and inability to iscriminate among randomly administered hocks. Individuals with low MHPG were less nxious and more pain sensitive than those sub-ects with relatively higher MHPG. These find-ngs support previous observations of a relation-hip between anxiety and noradrenergic function nd suggest that high anxiety in normal controls nay reduce the ability to discriminate the amount f pain an individual feels. This rather unique elationship in normals is opposite the usual ex-ectation of clinicians treating patients with hronic pain. That is, pathological anxiety in hronic pain patients is often thought to decrease ain thresholds. Preliminary evidence from the uthors' laboratory also suggest that patients with hronic pathological anxiety may become more ain sensitive with increasing degrees of state nxiety. Increases in state anxiety, therefore, may ave opposite effects on pain discriminability in normal controls compared to patients with chronic anxiety disorders, suggesting that the relationship between anxiety and pain may be nonlinear.

The authors' findings suggest that reducing some patients' anxiety with anxiolytics might intensify, rather than decrease, the amount of pain experienced as measured by the insensitivity index. If this hypothesis is correct it might explain why clonidine, which has acute antianxiety effects in depressed and phobic anxious patients, lacked group analgesic activity in normal human volunteers as measured by the insensitivity index (Uhde et al. 1980, 1981, 1982). These findings in man support and extend previous animal research suggesting an important role for noradrenergic systems in the modulation of anxiety and pain.

Current Knowledge of Tricyclic Antidepressant Response Indicators

David H. Tilley, M.P.H.,[1] Solomon C. Goldberg, Ph.D.,[1] and Robert O. Friedel, M.D.[1]

Since the early 1960s, a substantial amount o clinical research has been aimed at refining an targeting the therapeutic application of tricycli antidepressants (TCA). Attempts to detect meaningful correlations between patient characteristi and treatment response have been an importan aspect of this work. Symptoms, patient history personality variables, and biological markers hav been and are currently being studied for thei response indicator value.

In order to characterize the current state o knowledge of TCA response indicators, th authors have reviewed the literature (controlle clinical research and nodal review articles) an polled substantial panels for expert and practitioner opinion among psychiatrists. The expe panel consisted of productive and widely accepte researchers in the field drawn from the America College of Neuropsychopharmacology (ACNP membership roster and literature citation. Th practitioner panel consisted of members of th Virginia Neuropsychiatric Society who "frequently" use TCA in the treatment of depressed patients. Panel respondents were presented with a list of 41 proposed response indicators and asked to classify each item as 1) indicative of positiv clinical response to TCA, 2) indicative of non response (no better than placebo), or 3) of no indicative value with respect to TCA response.

The authors consider both homogeneity and diversity among sources helpful in understanding their current state of knowledge, in identifying areas which merit further research attention, and in forming research questions and hypotheses The following tables display the more interesting areas of agreement and disagreement among sources, and provide some insight with respect t currently important questions:

---

[1] Medical College of Virginia, Richmond, VA 23298.

1. Does the expert panel agree on anything or is there no consensus on the state-of-the-art regarding TCA response indicators?
2. To what extent do general psychiatric practitioners agree or disagree with expert opinion?
3. How does accumulated clinical wisdom compare with findings reported in the literature?

Areas of Agreement

Agreement among panel members and between panels is so strong with respect to the first 10 indicators shown in Table 1, that they might reasonably be considered current clinical knowledge. The virtual coincidence of these items and Diagnostic and Statistical Manual-III (DSM-III) criteria for melancholia supports the proposition that TCA therapy is an appropriate treatment for the disorder.

Table 1

Positive Response Indicators on Which Experts and Practitioners Agree

Indicator	Expert Panel (% +)	Practitioner Panel (% +)
Weight loss	82	92
Early morning awakening	79	97
Psychomotor retardation	89	94
Loss of appetite	82	94
Primary depression	86	93
Prior episodes	82	90
Poor concentration	68	88
Anhedonia	75	68
Better in evening	68	78
Blames self	68	83
Midnight awakening	64	76
Fatigue and lethargy	61	75

Table 2

Nonresponse Indicators on Which Experts and Practitioners Agree

Indicator	Expert Panel (% –)	Practitioner Panel (% –)
Inadequate personality	71	83
Secondary to antisocial personality	72	86
Hallucinations	75	83
Energetic	64	86
Delusions	75	63

While Table 2 (nonresponse indicators) shows substantial agreement on three items (inadequate personality, secondary to antisocial personality disorder, and hallucinations), no nonresponse indicator achieved the level of concurrence demonstrated for the six leading positive indicators (Table 1). Both panels responded with more agreement to positive indicators than to nonresponse indicators. In addition to the items shown in Table 2, there was fair concurrence on the nonresponse indicative value of other items describing "secondary depression" (secondary to alcoholism, secondary to schizophrenia, and secondary to obsessive-compulsive disorder).

Table 3 compares panel results with results cited in literature reviews. The positive indicative value of vegetative signs of depression (weight loss, early morning awakening, and psychomotor retardation) is strongly and consistently supported by the literature. Anhedonia, anorexia, and self-reproach are supported by panel responses as indicators of positive TCA response, but the literature is less conclusive. The literature is of little help in verifying the indicative value of primary depression, prior episodes, poor concentration, and diurnal variation. *None of the nonresponse indicators selected by the authors' panels showed consistent results in the literature.*

Table 3

Concensus Indicators Compared to the Literature

Indicator	Bielski and Friedel[a]	Nelson and Charney[b]
Weight loss +	+	slight +
Early morning awakening +	+	slight +

Expert and Practitioner Opposing Views

Indicator	Expert Panel	Practitioner Panel
Irritable	25% +	79% +
Somatic anxiety	18% +	66% +
Rejection sensitivity	3% +	64% +
Blames others	0% +	76% +
Craving for sweets	21% −	75% −

Table 6

Items of Greatest and Least Agreement

Greatest Agreement	Least Agreement
Weight loss	Agitated
Early morning awakening	Hypochondriasis
Psychomotor retardation	Blames others
Anhedonia	Rejection sensitivity
Anorexia	Somatic anxiety
Self-Reproach (blames self)	Irritability
	Craving for sweets

Areas of Disagreement

Table 4 shows a series of items alluded to in the literature which are either contradicted (insidious onset) or not substantially supported by panel responses.

Marked response differences between expe and practitioner panels are noted with respect t items listed in Table 5. All of these items have appeared in the literature as descriptive of "atypica depression" and attempts have been made t associate them with positive response t monoamine oxidase inhibitors (MAOIs).

In reviewing these data, it is interesting to distinguish items of greatest and least agreement. Table 6 displays the six items which stimulate th most consistent responses, and the seven item which stimulate the most diverse responses. Th diversity of response to these latter items ma serve to identify areas where research might b most useful in improving our ability to distingui TCA responders and nonresponders. Conversely, there seems to be little need to further documen the indicative value of weight loss, early mornin awakening, psychomotor retardation, anhedoni anorexia, or self-reproach.

Comment on Individual Items

"Abnormal MHPG"—Recent research whic tends to devalue MHPG as an indicator seem not to have penetrated the practitioner panel a well as it has the expert panel.

"Precipitant".—So few experts value the presenc or absence of a precipitant to episode as t response indicator that it might be worthwhi to counsel practitioners to ignore the matter.

"Blames other"—This item produced the greate net variance between expert and practitione opinion in that practitioners felt it was a positive indicator and the experts felt it wa worthless.

"Craving for sweets"—Much more significance as a nonresponse indicator is ascribed by practitioners than by experts. (75/21%)

"Delusional"—The relatively high valuation of this item as a nonresponse indicator may be impeding the concurrent use of TCA and a neuroleptic in the treatment of depression with delusions. Recent literature supports concurrent TCA/neuroleptic therapy as the treatment of choice.

Effects of Membrane Fluidity on Secretion and Receptor Stimulation

Fulton T. Crews, Ph.D.[1]

Introduction

The secretion of hormones and neurotransmitters as well as receptor mediated signal transduction are processes involving membranes. The initial secretory event involves a stimulus which causes a change in membrane permeability and/or other factors which lead to an increase in the intraneuronal calcium concentration. The increase in intraneuronal calcium concentration activates exocytosis, i.e., a mechanism where the membrane of the transmitter containing granule fuses with the neuronal plasma membrane releasing the granule contents extracellularly. This change in membrane permeability, which is necessary for secretion, is dependent on a change in membrane properties.

Once hormones or neurotransmitters are released, they carry out their specific functions by interacting with nerves or other target tissues. The initial event is the recognition of the hormone or transmitter by a receptor macromolecule on the outer surface of the cell membrane. The binding of the transmitter to its receptor then triggers a series of complex chemical and physical reactions in the membrane which permits the cell to carry out its specific function. Each of these reactions, i.e., receptor binding and coupling to ion channels and/or enzymes, is dependent on a suitable membrane environment. Thus, the metabolism of lipids as well as the lipid composition of the membrane plays an important role in the transduction of neurotransmitter, hormone, and other signals through the cell membrane.

Method

Membrane Fluidity

According to the now generally accepted fluid-mosaic model of membrane structure (Singer & Nicolson 1972), integral membrane proteins have hydrophobic ends embedded in the lipid matrix of the membrane which is at least in some parts fluid. The fluid properties of the lipid matrix have been suggested to play an important role in membrane transport (Coleman 1973), enzyme activity (Melchoir & Stein 1976), and other cell functions including receptor binding and stimulation (Rimon et al. 1978). Many membrane-bound enzymes and receptors have several subunits which interact within the membrane. Thus, the rate of subunit diffusion, rotation, and collision, as well as the maximal activity of enzymes, can be directly effected by the fluid properties of the lipid matrix in the membrane.

Phospholipid Methylation and Membrane Fluidity

Recent studies on enzymes altering membrane fluidity have centered on two methyltransferase enzymes that methylate phosphatidylethanolamine to form phosphatidylcholine. Although the methylation pathway is a minor pathway for the synthesis of phosphatidylcholine, evidence suggests that it is involved in both secretion and receptor-mediated membrane signal transduction. The two phospholipid methyltransferases have only recently been found to be present in rat brain and have their highest specific activity in the synaptosomal plasma membrane (Crews et al. 1980a; Mozzi & Porcellati 1979). The first enzyme, phospholipid methyltransferase I (PMT I), methylates phosphatidylethanolamine one time to form phosphatidyl-N-monomethyl-ethanolamine. PMT I has an optimum pH of 7.5 and a low apparent K_m for S-adenosyl-L-methionine (SAM), the methyl donor. The second enzyme, phospholipid methyltransferase II (PMT II), catalyzes two successive methylations of phosphatidyl-N-monomethyl-ethanolamine to form phosphatidylcholine. PMT II has an optimum pH of 10.5, a high apparent K_m for SAM, and can be differentially solubilized by sonication. These observations suggest that the synaptosomal fraction of rat brain contains at least two methyltransferases which catalyze the synthesis of phosphatidylcholine. Blusztajn et al. (1979) have demonstrated the formation of phosphatidylcholine by the methylation pathway in calf caudate nucleus. In addition, this group has demonstrated the *in vitro* formation of free choline from phosphatidylcholine synthesized through the methylation pathway (Blusztajn & Wurtman 1981). Since these enzymes have been shown to affect transmitter-receptor stimulation in erythrocytes (Hirata et al. 1979b), astrocytoma cells (Strittmatter et al. 1979), and many other cell types (Hirata & Axelrod 1980), it seems likely they are involved in synaptic transmission.

---

[1] Department of Pharmacology, University of Florida College of Medicine, Gainesville, FL 32610.

Evidence for the asymmetric localization of phospholipid methyltransferases in synaptosome membranes has been obtained by selective proteolytic digestion using trypsin in intact and lysed synaptosomes (Crews et al. 1980c). Trypsin treatment caused a small reduction, about 13 percent, in PMT I activity in intact synaptosomes, while in lysed synaptosomes it destroyed 83 percent of the activity. This suggests PMT I mainly faces the cytoplasmic side of the plasma membrane where trypsin cannot penetrate. Trypsin treatment reduced PMT II activity by 57 percent in intact synaptosomes, and by 95 percent in lysed synaptosomes (Figure 1). The loss of PMT II in intact synaptosomes after trypsin treatment represents the fraction of the enzyme localized on the exterior side of the plasma membrane and indicates that PMT II is mainly present on the outer surface of the membrane. The additional loss of PMT II activity in lysed preparations probably represents PMT II present on vesicles, mitochondria, and other intrasynaptosomal particles.

Similar experiments using phospholipase C suggested that in intact synaptosomes phosphatidyl-N-monomethylethanolamine is buried within the membrane or located on the cytoplasmic side, whereas phosphatidylcholine and phosphatidyl-N,N-dimethylethanolamine are exposed to the outer surface of the membrane (Crews et al. 1980c). The phospholipid methyltransferase enzymes have also been found to be asymmetrically distributed in liver microsomal membranes (Higgins 1981) and in rat erythrocyte ghosts (Hirata & Axelrod 1978a). These data suggest the stepwise methylation and translocation of a fraction of the methylated phospholipids from the cytoplasmic side to the outside of the membrane (Figure 2).

The methylation and rapid vectorial rearrangement of phospholipids has been shown to affect membrane fluidity. Using varying concentrations of SAM, it was observed in rat erythrocyte ghosts that the membrane viscosity, as measured by fluorescent polarization, using diphenylhexatriene (DPH), decreased in parallel with the synthesis of phosphatidyl-N-monomethylethanolamine (Hirata & Axelrod 1978b). Other studies on chicken erythrocytes have found that concanavalin A will increase phospholipid methylation and simultaneously decrease membrane viscosity (Nakajima et al. 1981). This study used the electron spin resonance spectra of a stearic acid spin label to estimate membrane viscosity and found that methylation inhibitors could block the concanavalin A-induced change in fluidity. These studies suggest that the methylation of phosphatidylethanolamine and the rapid translocation of the methylated phospholipid has an important influence on membrane fluidity.

Phospholipid Methylation, Ca^{2+} Flux and Exocytosis

Mast cells and basophils have been used to study the cellular mechanisms involved in secretion (Douglas 1978; Kazimiercyak & Diamant 1978). The normal stimulus for mast cell secretion is the reaction of a specific antigen with antibodies, i.e., immunoglobulin E (IgE), which are bound to the cell surface. Mast cells exposed to antigen accumulate $^{45}Ca^{2+}$. Furthermore, antigen-stimulated $^{45}Ca^{2+}$ accumulation occurs even when the secretory response is inhibited by the cell being deprived of energy (Foreman et al. 1977), thereby supporting the hypothesis that calcium influx is an early event in the secretory response

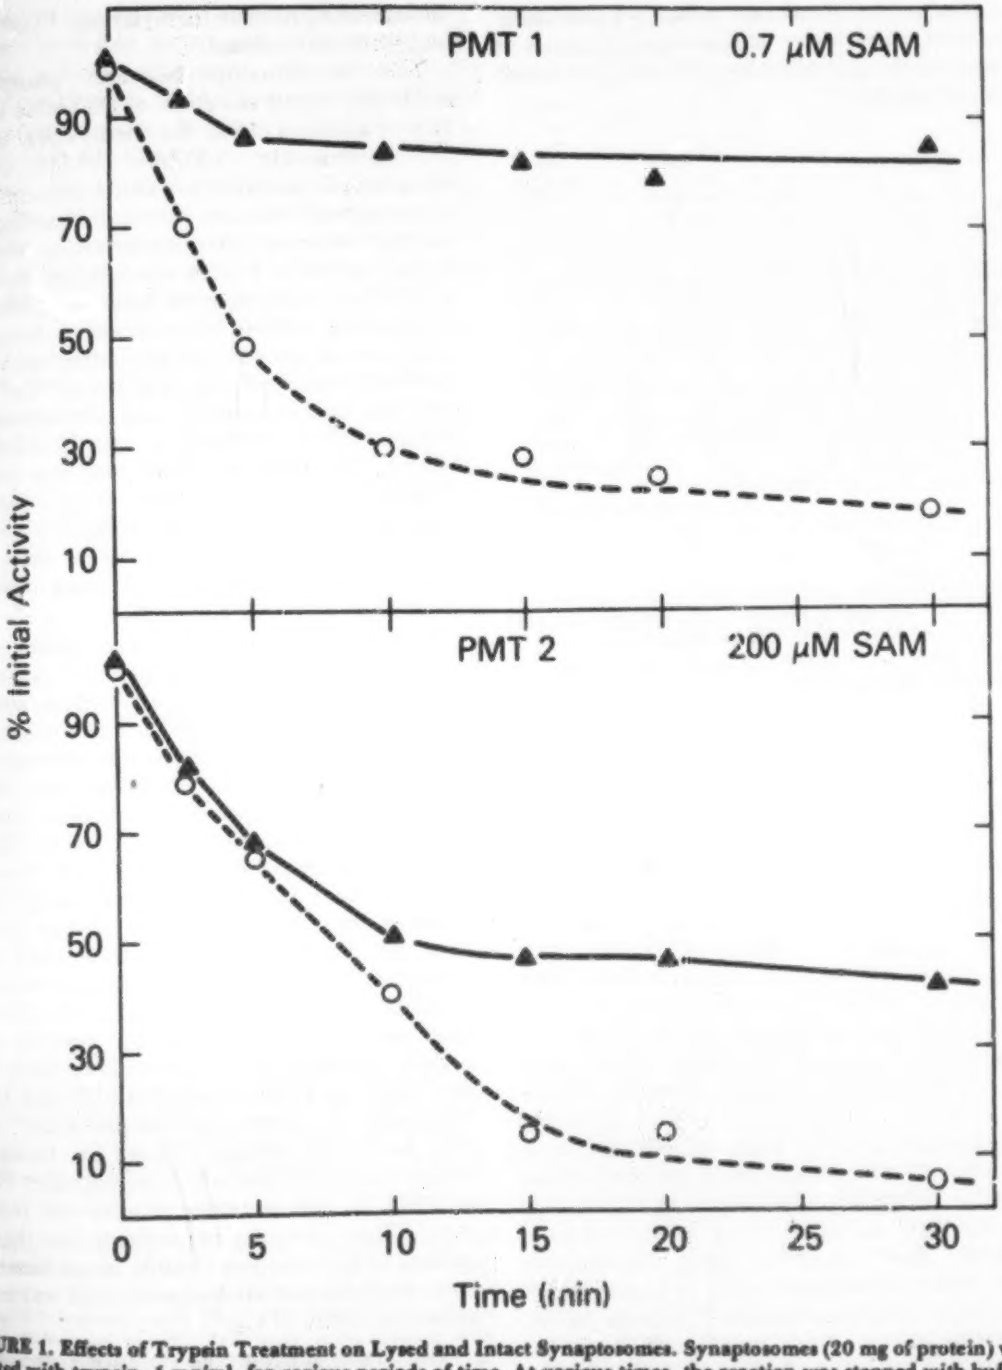

FIGURE 1. Effects of Trypsin Treatment on Lysed and Intact Synaptosomes. Synaptosomes (20 mg of protein) were incubated with trypsin, 1 mg/ml, for various periods of time. At various times, the reaction was stopped with buffer containing 5 mg/ml pancreatic trypsin inhibitor with 2 percent nonident and assayed for phospholipid methyltransferase I (PMT I) or phospholipid methyltransferase (PMT II) activity as described in Crews et al. (1980c). (▲ – ▲) Intact synaptosomes, (○ – ○) lysed synaptosomes.

The mechanism of calcium influx is particularly important, since many endogenous regulators of release are thought to act by inhibiting the initial influx of calcium.

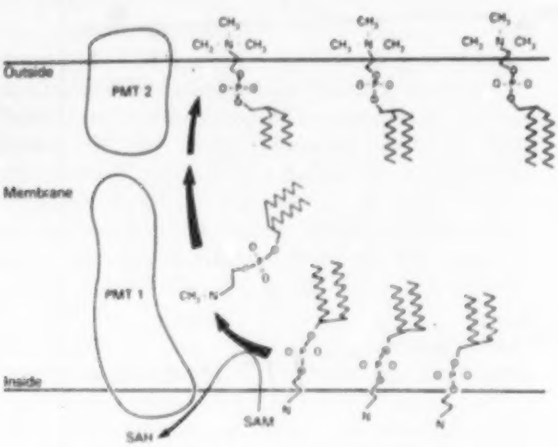

FIGURE 2. Schematic Diagram of Methylation and Translocation of Phospholipids in Synaptosomal Membranes. SAM is S-adenosyl-L-methionine, SAH is S-adenosyl-L-homocysteine.

The relationship between phospholipid methylation and histamine release was first studied using rat mast cells. Concanavalin A (Con A), a lectin which binds membrane glycoproteins (Siraganian 1976) was initially used to stimulate the secretion of histamine. Stimulating rat mast cells with Con A resulted in a rapid increase in methylated phospholipids which was followed by the release of histamine (Hirata et al. 1979a). After about 3 minutes, there was a fall in the methylated phospholipids suggesting further metabolism of these lipids. More recent studies on phospholipid methylation have used antibodies raised against IgE receptors on rat basophilic leukemia cells (anti-RBL). It is known that F(ab')$_2$ fragments of anti-RBL cause an influx of ^{45}Ca^{2+} and release histamine by bridging IgE receptors. F(ab')$_2$ fragments of anti-RBL also induce a rapid increase in phospholipid methylation which precedes ^{45}Ca^{2+} influx and histamine release (Ishizaka et al. 1980). Monovalent Fab' fragments failed to increase phospholipid methylation, induce ^{45}Ca^{2+} uptake, and release histamine. These findings suggest bridging of IgE receptors is necessary to initiate phospholipid methylation, ^{45}Ca^{2+} in
and histamine release.

The relationship between phosphol
methylation and secretion of histamine was
ther established using the methylation inhi
3-deazaadenosine (3-DZA). 3-DZA inhi
phospholipid methylation and histamine rel
in an almost identical concentration-depend
manner whereas other methylations were
slightly affected. 3-DZA also blocked the rel
of [^{14}C]-arachidonic acid from prelabeled c
(Crews et al. 1980b). More recent studies on R
cells have shown that antigen stimulation of
sensitized cells results in an influx of ^{45}Ca^{2+} w
precedes both histamine and arachidonic a
release. When methylation was inhibited w
3-DZA, the influx of ^{45}Ca^{2+} was also inhib
(Figure 3) (Crews et al. 1981). These findings a
consistent with the hypothesis that the initial i
crease in phospholipid methylation alters me
brane viscosity following the opening of the C
channel.

Additional evidence for the critical role
phospholipid methylation in Ca^{2+} influx a
histamine release was obtained with mutant R
cells (McGivney et al. 1981). Two variant clo
of RBL cells were found which in response to a
tigen did not release histamine and had
calcium influx. However, stimulation with
calcium ionophore did induce calcium flux a
histamine release. Both mutant cell lines we
found to have IgE receptors suggesting a def
between the receptor and the calcium chann
One cell line was found to have PMT I a
almost no PMT II activity. A second variant ha
PMT II activity and no PMT I activity. Fusion
each cell line at a ratio of 1:1 resulted in t
growth of independent hybrids. Hybrids had no
mal levels of PMT I and PMT II activity a
responded to antigen-IgE mediated Ca^{2+} infl
and histamine release. Thus, by fusing t
nonsecreting cell lines which lacked either PMT
or PMT II, the secretory process was recon
tuted. These observations indicate that the cr
linking of IgE receptors results in an increase
both phospholipid methytransferases which th
allows an influx of Ca^{2+}.

The data suggest the following hypoth
(Figure 4): Antigen stimulation of the cells cro
links and aggregates IgE receptors which incre
the methylation of phospholipids resulting in

decrease in membrane viscosity. This decrease in viscosity probably occurs primarily in a specific domain where receptors, the phospholipid methyltransferases, the calcium ion channel, and other enzymes are localized. The change in viscosity could allow the opening of the Ca^{2+} channel. Thus, rapid changes lipid metabolism may alter the membrane fluidity in a highly localized domain within the membrane and thereby cause changes in the activity and coupling of proteins within this domain.

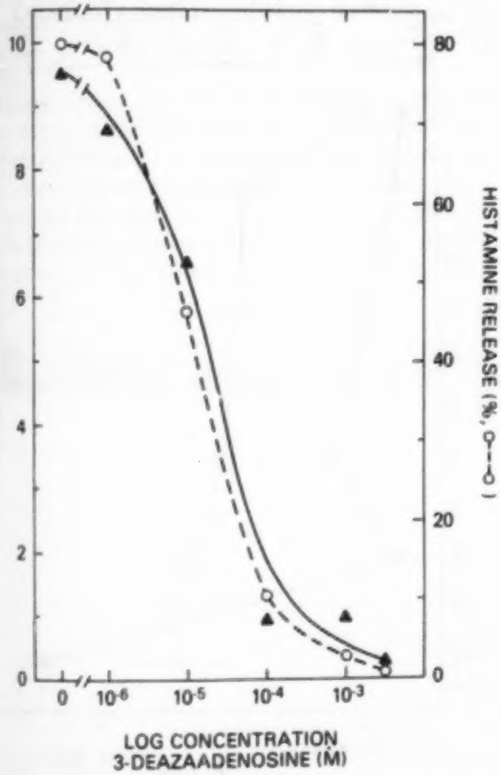

FIGURE 3. Effects of Various Concentrations of 3-Deazaadenosine (3-DZA) and Homocysteine Thiolactone on $^{45}Ca^{2+}$ Flux and Histamine Release. Rat basophilic leukemic cells (2 × 10^6 cells/well) sensitized with ovalbumin specific IgE were preincubated with various concentrations of 3-DZA and 2 × 10^{-4} M homocysteine thiolactone for 90 min. Cells were challenged with 10 µg/ml ovalbumin for 30 min. as described in Crews et al. (1981a).

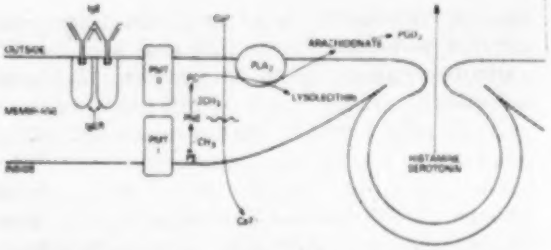

FIGURE 4. Schematic Diagram of Events During Antigen IgE Mediated Stimulation of Histamine and Arachidonic Acid Release. IgE is immunoglobin E and IgER is immunoglobin E Receptor. PE is phosphotidylethylnolamine which is methylated to PNE, i.e., phosphatidyl-N-monomethylmethanolamine, which would alter local membrane microviscosity allowing calcium influx. PC is phosphatidylcholine which can be hydrolyzed by PLA_2, i.e., phospholipase A_2 to lysolecithin, and arachidonate which is metabolized to PGD2, postaglandin D2.

Cholesterol/Phospholipid Molar Ratio and Membrane Fluidity

Although receptor stimulation may rapidly alter membrane fluid properties, the viscosity of the membrane is also affected by relatively low changes in composition. One change in composition that is known to alter membrane viscosity is the cholesterol to phospholipid molar ratio (C/P ratio). The interaction of the rigid backbone of cholesterol with phospholipid acyl chains increases the degree of order and restricts movement in the membrane interior (Cantor & Schimmel 1980). This increased order tends to increase viscosity (i.e., decrease fluidity), to abolish any phase transitions in membrane phospholipids and to alter the rotational freedom and position of proteins within the membrane lipid matrix (Shinitzky & Inbar 1976).

Studies of the synaptosomal plasma membrane (SPM) prepared from rats treated with ethanol have found changes in the C/P ratio. Ethanol and other anesthetics are thought to affect the nervous system by disrupting excitable membranes (Seeman 1972). This suggested that tolerance and physical dependence upon ethanol could be the result of an alteration in neuronal membranes during chronic exposure. The SPM from control rats, rats acutely treated with ethanol, rats dependent and intoxicated with ethanol, i.e., prodromal dependent rats, and rats undergoing ethanol withdrawal were prepared and the C/P ratio determined (Crews, Majchrowicz, & Meeks, submitted). There was a significant increase in the C/P ratio of SPM from rats dependent and intoxicated with ethanol as compared to the SPM of control and rats acutely treated with ethanol (Figure 5). Cholesterol incorporation into membranes has been shown to increase membrane organization (Shinitzky & Berenholz 1978). An increased C/P ratio has also been found in the membranes of ethanol tolerant mice (Chin et al. 1978). Synaptic membranes prepared from tolerant mice are resistant to ethanol-induced fluidization in vitro, i.e., they have become tolerant to the disruptive effects of ethanol (Chin & Goldstein 1977). The disruptive affects of ethanol on membranes are to some extent opposite to those of cholesterol. Cells may respond to the disruptive effects of ethanol by increasing the C/P ratio in their membranes. It is possible that under certain conditions cells can regulate their membrane fluidity by altering the C/P ratio. Certainly, the evidence suggests that tolerance and dependence to ethanol are related to alterations in nerve cell membrane organization and composition.

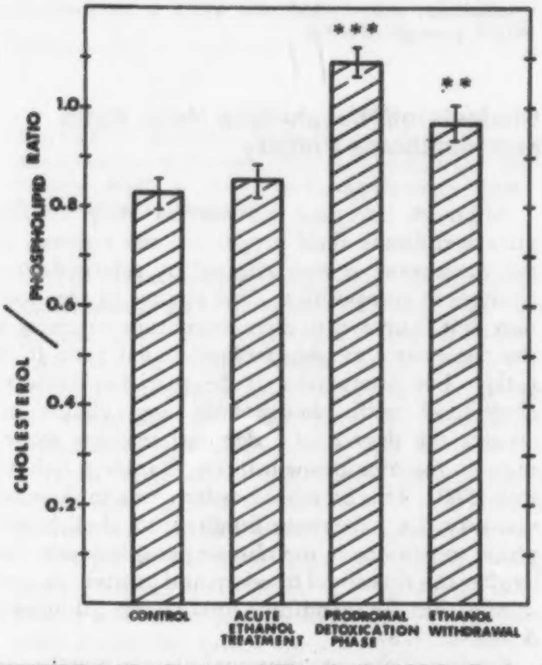

FIGURE 5. The Cholesterol/Phospholipid Molar Ratio of SPM Prepared from Rats after Various Alcohol Treatments. Controls were treated with water. Acute ethanol treatment involved a group of nonfasted animals given a single dose of ethanol (5 g/kg) 4 hrs prior to sacrifice. Prodromal detoxication phase group consisted of animals rendered physically dependent upon ethanol but were sacrificed while still intoxicated. The animals undergoing ethanol withdrawal syndrome were treated with ethanol as the prodromal group and were then decapitated at least 6 hrs after the onset of overt signs and symptoms of the ethanol withdrawal syndrome as described by Majchrowicz (1975).

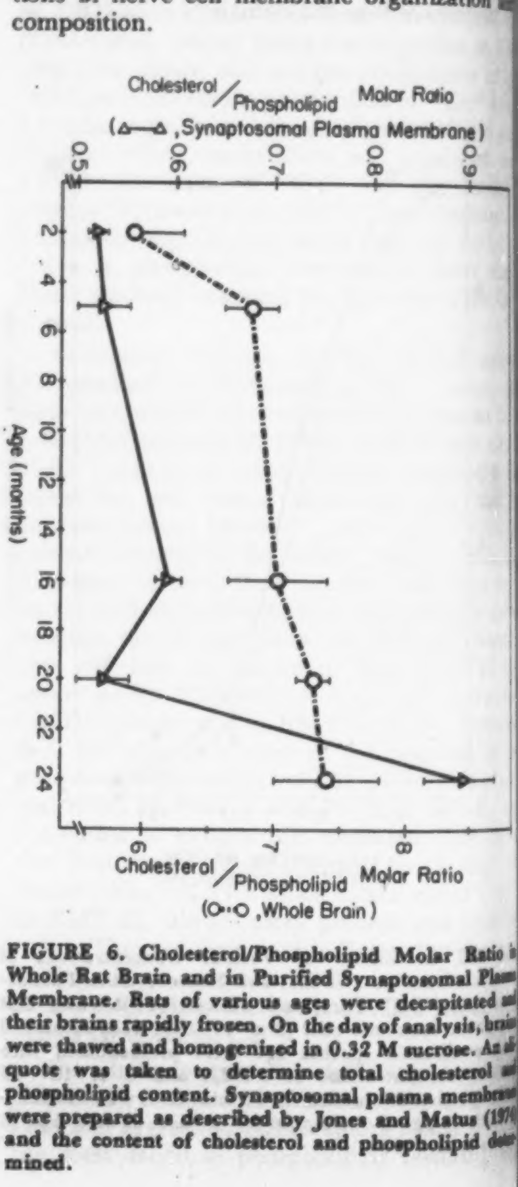

FIGURE 6. Cholesterol/Phospholipid Molar Ratio in Whole Rat Brain and in Purified Synaptosomal Plasma Membrane. Rats of various ages were decapitated and their brains rapidly frozen. On the day of analysis, brains were thawed and homogenized in 0.32 M sucrose. An aliquote was taken to determine total cholesterol and phospholipid content. Synaptosomal plasma membranes were prepared as described by Jones and Matus (1974) and the content of cholesterol and phospholipid determined.

In addition to the ethanol-induced changes in the C/P ratio of SPM, we have found that during aging there are changes in membrane C/P ratio. The SPM from rats of various ages was prepared and its lipid composition compared to that of whole brain. In whole brain the C/P ratio increased in young rats between 2 and 5 months of age and then remained relatively constant. In contrast, the C/P ratio of SPM changed very little in rats 2 to 20 months of age. However, the C/P ratio in SPM of rats 24 months of age was increased almost twofold over the C/P ratio of SPM in 20-month-old rats (Figure 6). This alteration in the SPM composition would be expected to alter synaptic transmission and may be related to changes in brain function which occur during aging.

To investigate the effects of changes in the C/P ratio on synaptic transmission, we studied carbachol stimulation of pyramidal neurons in the CA1 region of rat hippocampal brain slices. Since cholesterol transfer occurs between proteins rich in cholesterol to membranes containing smaller amounts, we incorporated cholesterol into hippocampal slices by perfusing them with buffered Yamamoto's solution containing 1 percent bovine serum albumin saturated with cholesterol (Figure 7). Recordings were made through a glass micropipette filled with 3 M NaCl saturated with fast green dye as described previously (Camacho & Phillips 1982). The cholineric agonist carbachol consistently excited cells in the hippocampus. Atropine blocked carbachol, suggesting muscarinic receptor mediated stimulation of firing. Incorporation of cholesterol markedly reduced carbachol induced firing of the hippocampal purkinje cells (Figure 7). When the response to carbachol was almost completely inhibited, perfusion buffers were changed and the cholesterol was washed out of the slice by perfusion with buffer containing albumin alone (Figure 8). Removal of cholesterol restored the carbachol response to near control levels. Characteristic action potentials were used to establish the identity of the cell, i.e., that the return of firing occurred in the same cell. It is possible that cholesterol incorporation disrupts the binding and/or stimulus transduction of acetylcholine like agents in neuronal membranes.

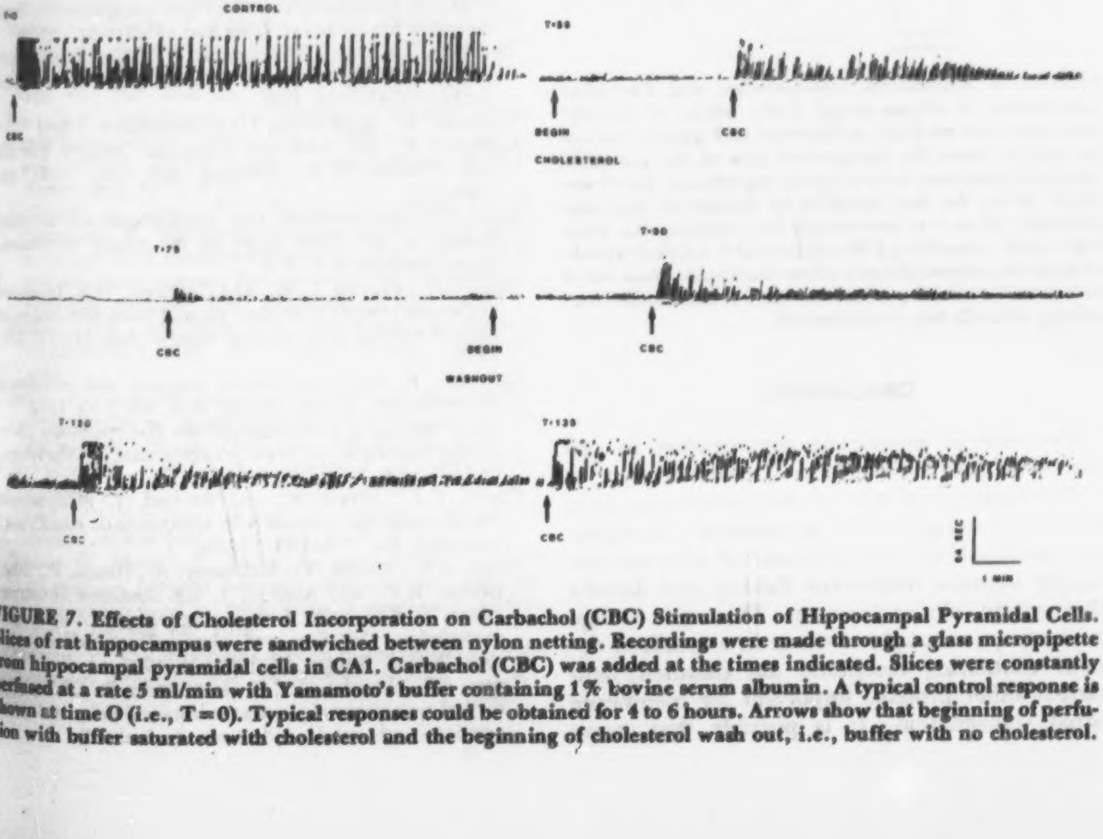

FIGURE 7. Effects of Cholesterol Incorporation on Carbachol (CBC) Stimulation of Hippocampal Pyramidal Cells. Slices of rat hippocampus were sandwiched between nylon netting. Recordings were made through a glass micropipette from hippocampal pyramidal cells in CA1. Carbachol (CBC) was added at the times indicated. Slices were constantly perfused at a rate 5 ml/min with Yamamoto's buffer containing 1% bovine serum albumin. A typical control response is shown at time O (i.e., T = 0). Typical responses could be obtained for 4 to 6 hours. Arrows show that beginning of perfusion with buffer saturated with cholesterol and the beginning of cholesterol wash out, i.e., buffer with no cholesterol.

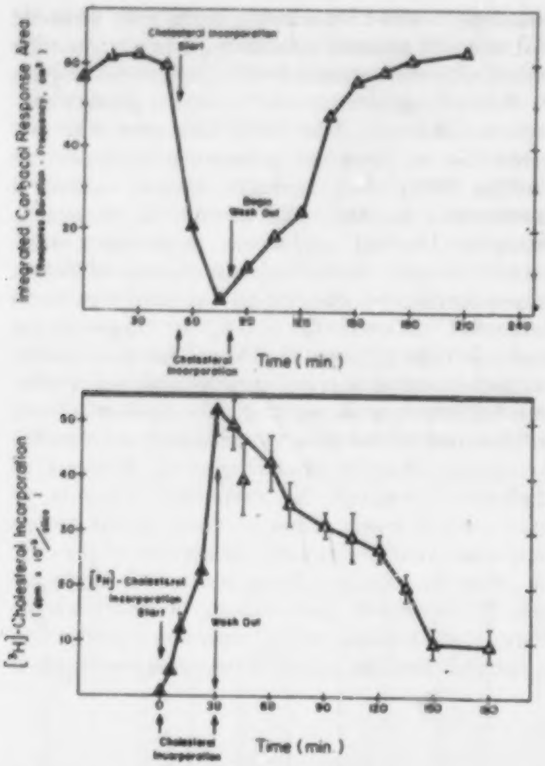

FIGURE 8. Cholesterol Incorporation and Carbachol Stimulation of Hippocampal Cells. Slices of rat hippocampus were perfused as described in Figure 8. The upper graph shows the intergraded area of the carbachol stimulated response from a typical experiment. The lower graph shows the incorporation of cholesterol into hippocampal slices was determined by perfusing the slices with media containing [³H]-cholesterol (1 uCi/ml) attached to bovine serum albumin where indicated. Wash out of cholesterol involved perfussion with the same buffer containing albumin but no cholesterol.

Conclusions

The role of membrane organization in cell function is just beginning to be understood.

The fluid properties of the membrane lipid matrix has a major effect on membrane function. The phospholipid methyltransferase enzymes can rapidly increase membrane fluidity and thereby alter certain cellular processes. This rapid change in viscosity is thought to occur in a localized domain containing receptors, ion channels, and various other proteins important for membrane signal transduction. It is possible that many transmitters and hormones transmit their sig by rapidly changing membrane fluidity.

The physiological and pharmacological facto that alter membrane fluidity by changing the C ratio are much slower than the rapid changes wi phospholipid methylation. In addition, it is n clear whether changes in bulk fluidity, the forma tion of distinct lipid domains, or some other effe of cholesterol on membrane structure, is responsi ble for the physiological changes that occur i cholesterol enriched membranes. However, it i clear that the regulation of cholesterol an phospholipid content provides the cell with ma potential ways to alter cell membrane functio Further studies on the regulation as well as th localization of the various membrane fluid do mains are likely to be exciting and physiologicall important studies on the functions of cell mem branes.

A Study of the Metabolism of Des-Tyrosine-γ-Endorphin Using an Improved HPLC System[1]

Hans Schoemaker, Ph.D.,[2] Andrew Chen, B.S.,[2] Thomas P. Davis, Ph.D.,[2] and Henry I. Yamamura, Ph.D.[2]

Introduction

In vitro proteolytic processing of β-endorphin (βE) by rat brain enzymes results in the formation of α-endorphin (αE, βE 1-16), γ-endorphin (γE, βE 1-17), and their non-opiate analogs des-tyrosine^1-α-endorphin (DTαE, βE 2-16) and des-tyrosine^1-γ-endorphin (DTγE, βE 2-17) (Austen et al. 1977; Burbach et al. 1980a). These peptide fragments, the presence of which has recently been confirmed in the rat (Verhoef et al. 1982) and human brain (Van Ree & De Wied 1981), differentially affect central mechanisms of adaptive behavior (Bohus 1981; De Wied et al. 1978). Consequently, βE homeostasis has been implicated in various aspects of behavioral adaptation (De Wied et al. 1978; Van Ree & De Wied 1981). Furthermore, it has been proposed that disturbances in βE homeostasis could be of etiological significance in psychopathological disorders (Berger & Barchas 1981; Bloom et al. 1976; De Wied 1979).

Several γE related peptides, and most notably DTγE, have shown neuroleptic-like activity in a variety of behavioral paradigms (Davis et al. 1981; De Wied et al. 1978; Dorsa et al. 1979). Clinical studies also indicate that DTγE may be of therapeutic value in the treatment of schizophrenia (Verhoeven et al. 1978, 1981). Like classical neuroleptics, DTγE decreases in ^{3}H-spiperone binding in the rat striatum nucleus accumbens (Pedigo et al. 1979b), which indicative of an inhibitory effect on the postsynaptic dopamine receptor. Since DTγE fails to af the *in vitro* binding of radiolabeled agonists an antagonists to the dopamine receptor (Pedigo e al. 1979a; Van Ree et al. 1978), it was suggeste that DTγE may exert its selective neuroleptic-li effect *in vivo* through an active metabolite (D Wied et al. 1980; Pedigo et al. 1979b). In the present study, the *in vitro* metabolism of DTγE wa examined with the use of a sensitive and selectiv high performance liquid chromatograph (HPLC) system that allows for a rapid and efficient separation of βE peptide fragments (Davis e al. 1982).

Method

The *in vitro* metabolism of DTγE was studie by incubating DTγE in a final concentration o 1-2 mg/ml with whole rat brain homogenates (5 mg tissue/ml), rat striatal slices (0.5 × 0.5 × 0. mm, approximately 25 mg tissue/ml), an homogenates of the human caudate nucle Postmortem human brain samples were obtaine at autopsy from subjects with no know neurological or mental disease. Autopsy too place within 3.5-16 hours after death, and tissue were stored at -80°C for 4-6 months before use After incubation at 37°C in 50 mM sodium potassium phosphate buffer (81 mM Na$^+$, 9 m K$^+$), pH 7.4, samples were boiled for 10 minute at 100°C and centrifuged at 15,000 × g for 15 minutes. The clear supernatant was stored a -20°C until HPLC analysis (Davis et al. 198 Schoemaker et al. 1982).

The HPLC analysis was performed using tw Model 6000A pumps and a Model 600 Solve Programmer (Waters Associates, Milford Mass.). Eluting peptides were detected using a Perkin-Elmer LC-65T variable wavelength UV detector (Perkin-Elmer, Norwalk, Conn.) set a 210 nm. Baseline drift due to mobile phase refractive index changes was corrected for using an Axxiom Model 301-99 Data Saver (Cole Scientific, Calabasas, Cal.). Recording and peak quantification was accomplished using a Hewlett-Packard 3390A integrator and strip chart recorder. Peptides were separated using a Beckman Ultraspher

ODS 5μ column maintained at 40°C, and a curve-linear gradient of acetonitrile against 0.1 M NaH_2PO_4 (pH 2.1) from 18 to 30 percent over 40 minutes at a flow rate of 2.0 ml/minute. Peptide quantification was based on the external standard method of analysis using reference peptides which had previously been tested for purity by chromatographic methods.

Endorphin fragments were generously donated by Drs. N.C. Ling (The Salk Institute), and H.M. Greven and J.W. van Nispen (Organon Int.).

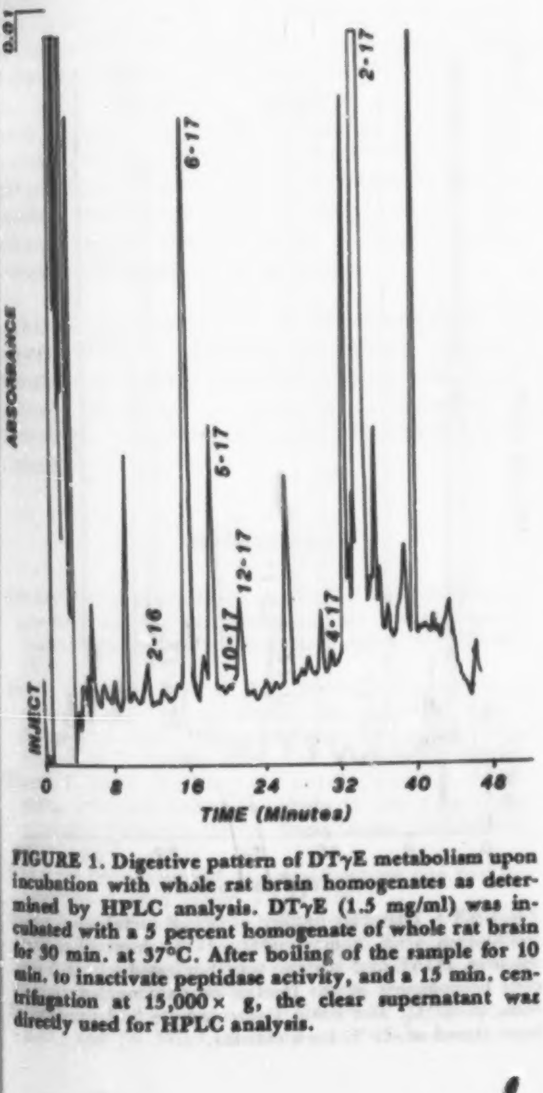

FIGURE 1. Digestive pattern of DTγE metabolism upon incubation with whole rat brain homogenates as determined by HPLC analysis. DTγE (1.5 mg/ml) was incubated with a 5 percent homogenate of whole rat brain for 30 min. at 37°C. After boiling of the sample for 10 min. to inactivate peptidase activity, and a 15 min. centrifugation at 15,000 × g, the clear supernatant was directly used for HPLC analysis.

Results

The HPLC method employed in the present experiments results in a rapid and efficient separation of βE related peptide fragments. The detection limit under these conditions is 10 ng for each peptide (Davis et al. 1982).

A representative fragmentation pattern of the metabolism of DTγE upon incubation with rat brain homogenates for 30 minutes is shown in Figure 1. The major metabolite was identified as βE 6-17, whereas minor metabolites could be identified as βE 4-17, βE 5-17, βE 10-17, βE 12-17, and βE 2-16 (DTαE). After a 30-minute incubation, approximately 33 percent of the parent DTγE could be recovered. After incubation of DTγE with boiled homogenates for 30 minutes DTγE was recovered unchanged, indicating that breakdown is indeed enzymatic. Conversely, no peptide peaks could be detected in extracts of tissue incubated in the absence of exogenously added DTγE. Time-course experiments (Schoemaker et al. 1982) indicated that the decline in residual DTγE levels was monoexponential with a half life of 14-15 minutes. The major metabolite, βE 6-17, reaches a maximal level of about 30 percent of that of the parent peptide, DTγE, after 30 minutes of incubation. Maximal levels of βE 5-17 were observed after 15 minutes of incubation, and represented about 5 percent of the residual amount of DTγE at this time.

A qualitatively similar pattern of metabolism was found upon incubation of DTγE with rat striatal slices. Prior to incubation, the slices were thoroughly rinsed with 2 × 10 ml buffer in order to remove intracellular enzymes from those cells damaged during the preparation of the tissue. Figure 2 illustrates the metabolic pattern observed after incubation at 37°C for 120 minutes. Major metabolites were identified as βE 5-17 and βE 6-17, whereas minor amounts of βE 2-16, βE 4-17, βE 10-17, and βE 12-17 were also present.

In addition, *in vitro* DTγE metabolism was studied using homogenates of the human caudate nucleus. Metabolism was qualitatively similar to that observed in whole rat brain homogenates and rat striatal slices (Figure 3). Also in this case βE 6-17 emerged as the major metabolite. Moreover, the fragmentation pattern was virtually identical between the different subjects studied.

Discussion

The metabolism of DTγE upon incubation with whole rat brain homogenates, rat striatal slices, and homogenates of the human caudate nucleus was examined using a newly developed, sensitive and selective HPLC chromatographic system for βE fragments. In each tissue preparation studied, the enzymatic breakdown of DTγE proceeded in a qualitatively similar manner, and βE 6-17 constantly emerged as the major metabolite. The βE sequences 2-16, 4-17, 5-17, 10-17, and 12-17 were also present but in minor amounts. βE 6-17 was previously reported to be among the major metabolites associated with DTγE digestion by peptidase activity in synaptosomal plasma membranes (Burbach et al. 1980b). Interestingly, the major DTγE metabolite identified in this study, βE 6-17, is the shortest γE related peptide to retain the full spectrum of behavioral effects of DTγE (De Wied et al. 1980), including its putative antipsychotic activity (Verhoeven et al. 1981). Like DTγE, βE 6-17 fails to affect the ^{3}H-spiperone labeled dopamine receptor *in vitro* (Pedigo et al. 19 Schoemaker et al. 1982). Similarly, no inhibition of ^{3}H-spiperone binding to rat striatal membranes could be demonstrated for C-terminal fragments of DTγE up to βE 14-17 in concentrations of 1 μM (unpublished observations). It therefore seems unlikely that the inhibitory effect of DTγE on *in vivo* ^{3}H-spiperone binding in the rat striatum and nucleus accumbens (Pedigo et al. 1979b) arises from a direct interaction of the γ-type endorphins with the postsynaptic dopamine recep

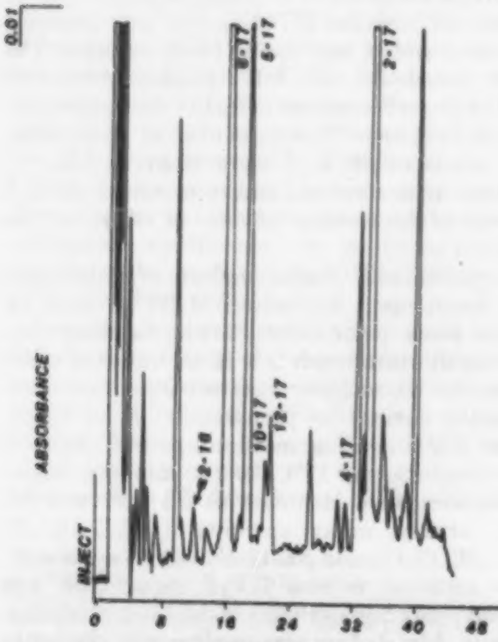

FIGURE 2. Digestive pattern of DTγE metabolism upon incubation with rat striatal slices. DTγE (1.5 mg/ml) was incubated with rat striatal slices (0.5 × 0.5 × 0.5 mm) for 120 min. at 37°C. Samples were prepared for HPLC analysis as described in Figure 1.

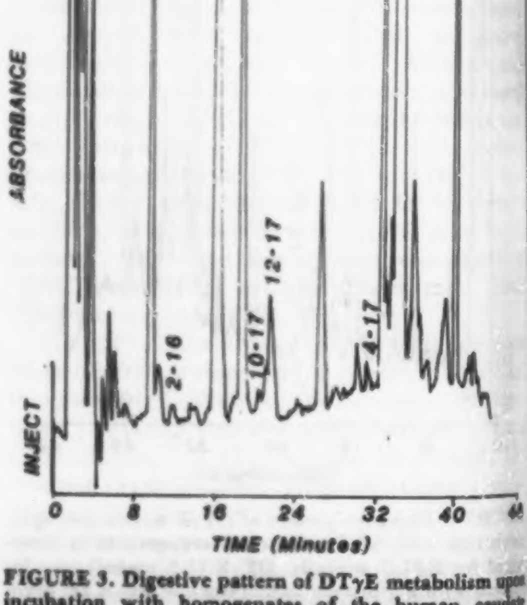

FIGURE 3. Digestive pattern of DTγE metabolism upon incubation with homogenates of the human caudate nucleus. DTγE (1.5 mg/ml) was incubated with a 5 percent homogenate of the human caudate nucleus for 30 min. at 37°C. The brain tissue sample had previously been stored at -80°C for 6 months.

tor. The possibility remains that DTγE alters dopaminergic activity in the mesolimbic and triatal pathways by an indirect effect on the postsynaptic dopamine receptor or through a presynaptic mechanism, as suggested by *in vitro* (Schoemaker & Nickolson 1980) and *in vivo* experiments (Davis et al. 1981; Nickolson 1981; Nickolson & Berendsen 1980; Van Ree & De Wied 1981).

Derangements in the balance of α-, β-, and γ-type endorphins in the human brain have been suggested to underly the etiology of schizophrenia (De Wied 1979). Thus, a relative excess of βE was hypothesized to result in the catatonic aspects of this disease, whereas an imbalance towards the α-type endorphins that show amphetamine-like behavioral activity (De Wied et al. 1978; Dorsa et al. 1979), would be prevalent in paranoid schizophrenia. The present findings that DTγE metabolism upon incubation with homogenates of the previously frozen human caudate nucleus proceeds similarly to that found using fresh rat brain tissues, suggest the feasibility of future studies directly addressing this hypothesis.

The Central Nervous System Control of the Immune System—Enkephalins: Antitumor Activities

Nicholas P. Plotnikoff, Ph.D.[1]

In 1979, Wybran, et al. reported that human blood T lymphocytes bear surface receptor-like structures for methionine-enkephalin. The present study explores the relationships between the central nervous system and the immune system.

The effects of leucine-enkephalin as well as the effects of methionine-enkephalin were studied in BDF mice inoculated with 1 × 10^4, 1 × 10^3, and 1 × 10^2, L1210 leukemia cells. An increase in survival time of the leucine-enkephalin treated mice was seen in mice inoculated with 1 × 10^2 L 1210 cells. Furthermore, the survivors managed to rechallenge to 1 × 10^4 cells. Higher doses of the enkephalins (30 mg/kg) were found to prolong survival of mice inoculated with 1 × 10^4 cells.

In addition, methionine enkephalin, in the presence of PHA, was found to stimulate lymphocyte blastogenesis at high molarities while diminishing (slightly) at low concentrations. The reverse appeared to be the case with leucine enkephalin; that is, high concentrations diminished blastogenesis and low conentrations stimulated blastogenesis.

It is proposed that the enkephalins play neuroendocrine role between the central nervous system and the pituitary-adrenal axis. In addition, it is proposed that the enkephalins released from the adrenals, in time of stress, stimulate the immune system.

A Behavioral Study of the Changes in the CNS of Mice After Subchronic Treatment With the Dopamine Autoreceptor Agonist 3-PPP

Stephan Hjorth, B.Sc.[1], David Jackson, Ph.D.,[2] Arvid Carlsson, M.D.,[1] and Per Lindberg, Ph.D.[3]

Introduction

It is becoming increasingly evident that changes in receptor sensitivity contribute to the long-term homeostasis of synaptic function in the dopamine (DA) systems of the central nervous system. This property of receptors to change their sensitivity may be of key importance in the clinical efficacy of a number of drugs and in the development of side effects.

We have recently described the properties of a new DA receptor agonist, 3-(3-hydroxyphenyl)-N-n-propylpiperidine (3-PPP) (Hjorth et al. 1981). This compound exhibits a considerable selectivity for DA autoreceptors and, except in very high doses, is essentially devoid of other psychopharmacological properties. This unique profile makes 3-PPP of considerable theoretical interest, both in its own right and as a tool for use in psychopharmacological research. Some preliminary behavioral studies of the effects of 3-PPP administered subchronically to mice are reported here.

Method

Animals and Equipment

Male mice (18-24 g at the beginning of experimentation) of the N.M.R.I. strain (Anticimex, Stockholm) were kept at 25 ± 1° on a 12-hour light-dark cycle, with food and water *ad libitum*. The locomotor activity of groups of three mice was assessed in four "M/P" 40 Fc electronic motility meters (Motron Products, Stockholm). In all activity studies, except where otherwise stated, recordings were commenced 5 minutes after drug challenge.

Chronic Pretreatment

Each mouse was injected twice daily, between 7:45 and 9:30 a.m., and between 4:00 and 5:45, with 23.5 mg/kg of 3-PPP expressed as the base, but given as the hydrochloride salt. The pretreatment dose was chosen with reference to the depressant potency of 3-PPP, and after several preliminary experiments. The subchronic pretreatment schedule lasted for 5 days (10 injections) and behavioral assessments were made 15 to 25 hours after the last subchronic dose. Control animals received an injection of saline (0.2 ml) at the appropriate times each day. All injections were intraperitoneal (i.p.), with an injection volume of 10 ml/kg. In the text, the doses of drugs are expressed in terms of the salt forms, except 3-PPP which is expressed in terms of the base.

Statistical Methods

Statistical comparisons were made with a two-tailed Student's *t*-test, in some cases preceded by an analysis of variance.

Results

Acute Experiments

In naive mice, the selective dopamine (DA) autoreceptor agonist 3-PPP (3-(3-hydroxyphenyl)-N-n-propylpiperidine) produced a dose-dependent depression of locomotor activity (Figure 1).

The duration of action of the depression was short, with no significant depression being noted 1 or more hours after a dose of 23.5 mg/kg i.p. (Table 1).

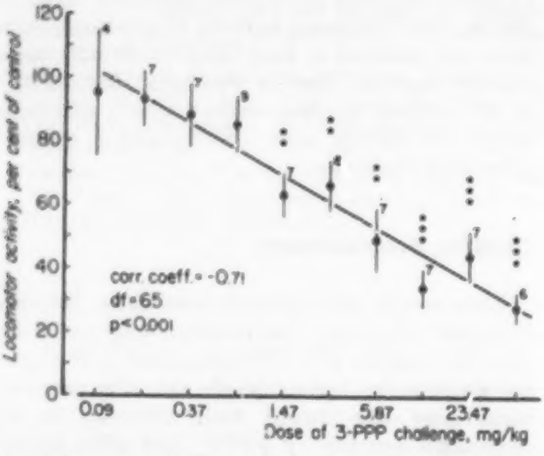

FIGURE 1. The effect of various doses of 3-PPP on the locomotor activity of groups of three mice. The data represent the means and standard errors of the activity in the 30 minutes beginning 5 minutes after injection, and each mean consists of 4 to 8 replicates. The line of best fit was calculated by regression analysis. $^{**}p<0.01$, $^{***}p<0.001$.

Subchronic Experiments

Mice, administered the drug twice daily (23.5 mg/kg i.p., in the morning and in the evening) for 5 days, were 15 to 25 hours after the last dose subsensitive to the locomotor depressant effects of a challenge with the same drug (Figure 2).

Table 1

The Effect of Different Treatment Times on the Locomotor Response of Mice to 23.5 mg/kg of 3-PPP

Treatment Time (h)	Treatment	Locomotor Activity	(*N*)
0	Saline	248 ± 8	(6)
	3-PPP	58 ± 14	(8)[a]
1	Saline	221 ± 21	(8)
	3-PPP	174 ± 10	(8)[b]
2	Saline	229 ± 13	(8)
	3-PPP	196 ± 12	(8)

[a] $p < 0.001$.
[b] $p = 0.056$ from the corresponding saline control.

Note: Locomotor activity was measured for 15 minutes either 0, 1, or 2 hours after injection of saline or 3-PPP. The locomotor activity is expressed as the counts per 15 minutes with standard error of the mean.

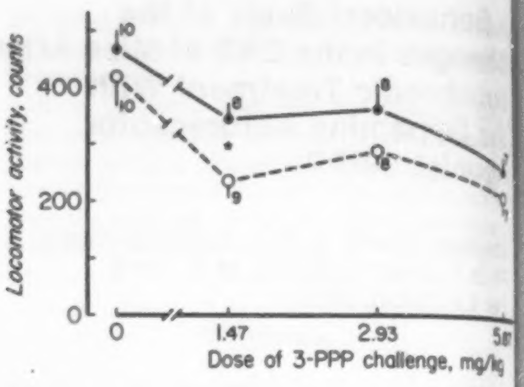

FIGURE 2. The effect of pretreatment of mice wi 3-PPP (•—•) or vehicle (○—○) on the response t challenge dose of 3-PPP. The data represent the mea and standard errors of the activity from 5 to 50 minu after beginning of the measurements. $^{*}p<0.05$ (for detai see the text).

Table 2

The Effect of Challenge with Apomorphine (0.5 or 1.0 mg/k on the Locomotor Response of 3-PPP or Vehicle-Pretreat Mice Treated with Reserpine (10 mg/kg) and α-M (250 mg/kg)

Dose of Apomorphine (mg/kg)	Locomotor Activity ± S.E.M. (*N*) 3-PPP-Pretreated	Vehicle-Pretreated
0	2 ± 1 (3)	3 ± 1 (3)
0.5	273 ± 38 (9)	262 ± 25 (9)
1.0	542 ± 34 (9)	563 ± 34 (9)

Note: The data represent the mean activities in the hour beginning 5 minu after challenge together with the standard errors of the means.

There was no change in the sensitivity of postsynaptic DA- and α-adrenergic receptors, as assessed by the locomotor stimulant effects of apomorphine and apomorphine plus clonidine, respectively, in reserpine- and α-methyltyrosine-treated animals (Table 2 and Figure 3).

However, 3-PPP-pretreated mice were supersensitive to the activating effects of *d*-amphetamine, and this supersensitivity was blocked by reserpine pretreatment (Figure 4 and Table 3).

In naive mice, a low, DA-autoreceptor selective dose of haloperidol (25 μg/kg) potentiated the locomotor stimulant effects of *d*-amphetamine (Figure 5).

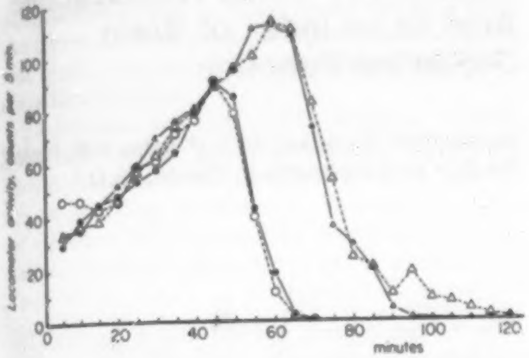

FIGURE 3. The effect of challenge with apomorphine (2 mg/kg) (circles) or apomorphine plus clonidine (2 mg/kg) (triangles) on the locomotor response of 3-PPP-pretreated (closed symbols) and vehicle-pretreated (open symbols) animals. Locomotor activity was assessed each 5 minutes, and the data represent the means of seven replicates. The standard errors of the means have been omitted for clarity, but in no case was there a significant difference in the response of the two groups to apomorphine challenge or to apomorphine plus clonidine challenge. The locomotor activities of animals challenged with saline or clonidine alone were essentially zero and have been omitted for clarity.

Table 3

Effect of Vehicle or Reserpine (10 mg/kg, 5 hv treatment) on the Response of 3-PPP- or Vehicle-Pretreated Mice to *d*-amphetamine (1.5 mg/kg) Challenge

Treatment	Challenge	Pretreatment Group Vehicle	3-PPP
Vehicle	Saline	388 ± 56 (6)	376 ± 29 (6)[a]
	d-Amphetamine	737 ± 90 (8)	1277 ± 166 (9)[b]
Reserpine	Saline	12.3 (2)	8.5 (2)
	d-Amphetamine	223 ± 17 (9)	285 ± 44 (9)[a]

[a] Not significant ($p > 0.05$)
[b] $p < 0.05$ from the corresponding vehicle-pretreatment group.

Note: The data represent the mean locomotor activities in the two groups during the 90 minutes immediately following *d*-amphetamine or saline challenge. The standard error of the means are given, and the numbers in parentheses represent the number of replicates.

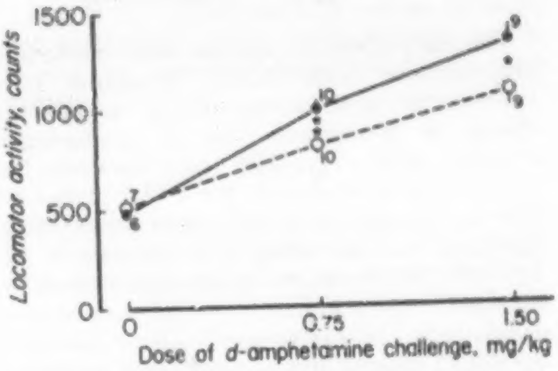

FIGURE 4. The effect of subchronic treatment with 3-PPP (or vehicle) on the locomotor response to *d*-amphetamine or saline challenge. The data represent the means and standard errors of the activity counts during the first hour of 6-10 replicates. ●—●, 3-PPP-pretreated: ○—○ vehicle-pretreated. $^*p < 0.05$, $^{**}p < 0.01$.

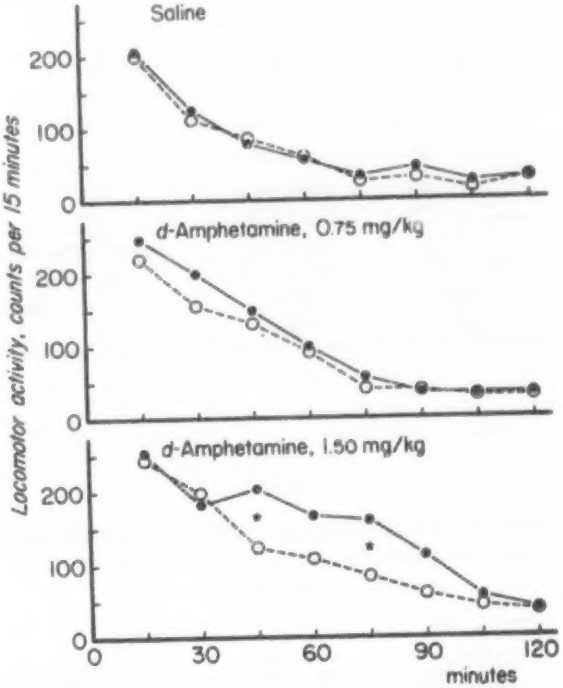

FIGURE 5. The effect of pretreatment of mice with haloperidol (25 μg/kg, 20 minutes ●—●) or acid vehicle (○—○) on their response to challenge with saline or *d*-amphetamine. Locomotor activity was monitored each 15 minutes for 2 hours. The data represent the means of 7-22 replicates with the standard errors omitted for clarity. $^*p < 0.05$.

Summary and Conclusions

The data obtained indicate that subchronic pretreatment with 3-PPP procuded DA-autoreceptor subsensitivity with no concomitant change in postsynpatic DA- or α-adrenergic receptor sensitivity. The supersensitivity to *d*-amphetamine evident in the 3-PPP pretreated mice may be due to the DA autoreceptors being subsensitive, thus leading to a reduction in the feedback control exerted by the DA released by the *d*-amphetamine.

Studies of Plasma Homovanillic Acid as an Index of Brain Dopamine Function[1]

Kenneth S. Kendler, M.D.,[2] John Y-K. Hsieh, Ph.D.,[2] and Kenneth L. Davis, M.D.[2]

In the rat, plasma levels of the dopamine (DA) metabolite homovanillic acid (HVA) change in parallel with brain levels of HVA after electrical stimulation, ablation of the brain DA system (Bacopoulos et al. 1979), and after administration of DA receptor-blocking neuroleptics (Bacopoulos et al. 1979; Kendler et al. 1981), and DA agonist drugs (Kendler et al. 1982). By selective inhibition of peripheral production of HVA by the drug debrisoquin, Kendler et al. (1981, 1982) showed that the alterations in plasma levels of HVA (pHVA) after DA blocking and agonist drugs were due largely or exclusively to the effect of the drugs on the brain. Based on these results and more limited studies in monkeys and man, pHVA has been proposed as a useful index of central DA function in human neuropsychiatric conditions. To further clarify the circumstances under which pHVA reflects brain DA function, the investigators examined the effects of a relevant behavioral stimulus, stress, and a relevant pharmacologic stimulus, probenecid, on central and plasma levels of HVA.

Approximately half of pHVA originates from sources other than the brain (Bacopoulos et al. 1979; Hoeldtke et al. 1974; Maas et al. 1979) probably from the sympathetic nervous system and the adrenal medulla. Stress increases plasma levels of catecholamines, including DA, several fold (Jindra et al. 1980; Van Loon et al. 1979). If appreciable amounts of these catecholamines were

metabolized to HVA, stress could induce a selective increase in the peripheral production of HVA that could obscure the relationship of pHVA to brain DA function.

To measure the rate of DA turnover in man, levels of HVA in the cerebrospinal fluid (CSF) have been measured before and after administration of the drug probenecid. Probenecid blocks the egress of HVA from CSF and brain and also inhibits the renal clearance of HVA from plasma (Faull et al. 1981). It is therefore of interest to determine whether plasma levels of HVA continue to correlate well with central HVA levels after administration of probenecid. Could a low dose of probenecid selectively block renal excretion of HVA without altering clearance of HVA from CSF and brain thereby permitting measurement of whole body production of HVA by measuring the rate of rise of pHVA?

Method

Stress Studies

Male, Sprague-Dawley rats, weighing 250-350 g, and food-deprived for 24 hours prior to sacrifice, were subject to one of three forms of stress: brief (4 minutes) ether stress, one 90-minute period of restraint stress, and five daily 150 minutes periods of restraint stress. Blood was obtained by open-chest cardiac puncture after which the brains were immediately removed and frozen on dry ice. Immediate decapitation with blood collected from the carotid arteries was used as a control for the brief ether stress. Since no difference was found between these two groups, open-chest cardiac puncture after brief ether anesthesia was used for both control and experimental animals in further studies.

Probenecid Studies

Fasted, male Sprague-Dawley rats were administered vehicle or probenecid (20,40,60, and 80 mg/kg) 4 hours prior to sacrifice. Plasma for HVA levels was obtained just prior to lumbar puncture in seven psychiatric patients after no pretreatment and again after the administration orally of probenecid 100 mg/kg over 24 hours.

Free HVA in brain and CSF was measured by high-performance liquid chromatography and in plasma by gas chromatography/mass spectrometry.

Results

Brief ether stress compared to controls sacrificed by immediate decapitation had no significant effect on either plasma or whole brain HVA concentrations (Table 1). Similarly, one episode of restraint stress did not significantly alter plasma or whole brain HVA concentrations (Table 2). However, repeated restraint stress produced a small but significant 22 percent increase in pHVA and only a nonsignificant 7 percent increase in whole brain HVA (Table 3).

Table 1

The Response of Plasma and Whole Brain HVA in the Rat to Brief Ether Stress vs. Immediate Decapitation (*N* = 7 per Group)

Treatment	Plasma HVA (ng/cc ± SEM)	Whole Brain HVA (ng/g ± SEM)
Brief ether stress	3.1 ± 0.3	83.0 ± 5.8

p	<.001	<.001

In the rat, neither 20 nor 40 mg/kg of probenecid produced a significant alteration in the concentrations of HVA in plasma or brain (Table 4). However, both 60 and 80 mg/kg produced significant and parallel increases in plasma and whole brain HVA (Table 4, Figure 1). The correlation of plasma and whole brain in this experiment was + .078 ($N = 30$) ($p < 0.001$). In psychiatric patients, probenecid (100 mg/kg over 24 hours) produced a highly significant increase in plasma and CSF HVA of approximately equal magnitude (Table 5, Figure 2). The correlation of plasma and CSF HVA in these patients was +0.86.

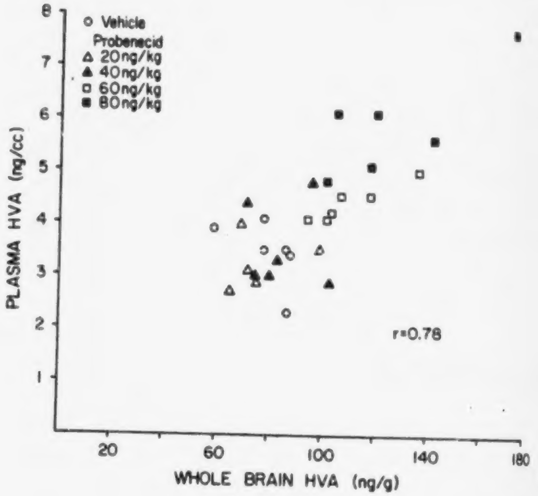

FIGURE 1

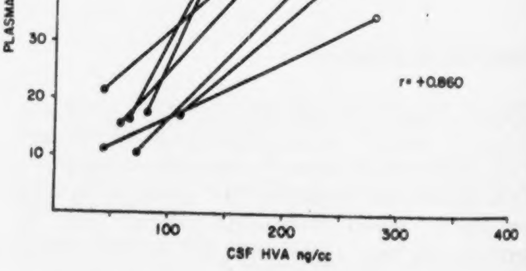

FIGURE 2

Discussion

Acute ether and immobilization stress produced no significant increase in pHVA concentrations in the rat. However, chronic restraint stress, which has been shown to increase levels of catecholamine synthetic enzymes (Kvetnansky 1980), produced a small but significant increase in pHVA. Although these results suggest that chronic, but not acute, stress may selectively increase peripheral production of HVA, two methodologic issues remain to be addressed. First, since even immediate decapitation produces a significant elevation in plasma levels of catecholamines, this method of sacrifice may not produce true "controls" for the examination of the effects of stress on pHVA. The investigators are currently using animals with chronic indwelling arterial cannula for "controls" in studies of the effects of stress on pHVA. Second, chronic stress could elevate pHVA concentrations in ways other than increasing peripheral HVA production. Hemoconcentration and decreased HVA clearance caused by the prolonged struggling and physical exhaustion may be the mechanism for the elevation of pHVA by chronic stress. The investigators are conducting experiments to examine this possibility. Despite these methodologic difficulties, these results suggest that compared to the effects of neuroleptic drugs (Kendler et al. 1981), stress probably has a relatively small effect on pHVA concentrations.

After probenecid administration in both rat and man, plasma concentrations correlate highly with central levels of HVA. In the rat, the threshold dose of probenecid necessary to produce a significant increase in plasma and brain concentrations of HVA was the same (60 mg/kg). These results suggest that selective inhibition of renal excretion of HVA by probenecid without altering transport of HVA from brain may be difficult to achieve. However, since after probenecid, pHVA correlates highly with central measures of HVA, measurement of pHVA levels in man after probenecid may be a useful measure of brain DA turnover.

Plasma Haloperidol Levels and Clinical Response in Acute Schizophrenia

Irl Extein, M.D.,[1] K.A. Augusthy, M.D.,[1] Mark S. Gold, M.D.,[2] A.L.C. Pottash, M.D.,[2] David Martin, B.S.,[2] and William Z. Potter M.D., Ph.D.[3]

Over the past three decades, neuroleptic medications have become the treatment of choice for schizophrenia, particularly for acute (Casey et al. 1960; Extein 1980) and prophylactic (Davis 1975) treatment of psychosis. However, a significant proportion of schizophrenic patients have an inadequate antipsychotic response to neuroleptics (Ayd 1975). One source of the variability in clinical antipsychotic response may be variability in plasma levels of medication. Several investigators have studied the relationship of neuroleptic levels and response to treatment (Calil et al. 1979; Forsman & Ohmen 1976; Magliozzi et al. 1981; Smith et al. 1979; Tune et al. 1980). Some of these investigators have suggested "therapeutic windows" for plasma levels of neuroleptics, including haloperidol (Forsman & Ohmen 1976; Magliozzi et al. 1981; Tune et al. 1980).

Haloperidol is a potent neuroleptic with a relatively low profile of sedation and cardiovascular effects that is extremely useful in the treatment of acute psychosis (Extein 1980). Steady-state plasma levels are achieved in about 6 days (Forsman & Ohmen 1976). Because haloperidol has no significant active metabolites, it is an ideal medication to use to study the relationship between clinical efficacy and neuroleptic levels. Most other neuroleptics have active metabolites, and studies of plasma levels and clinical response to these medications must involve assays of multiple compounds or dopamine-receptor binding assays (Calil et al. 1979). Magliozzi et al. (1981) have recently reported a therapeutic window for haloperidol levels in schizophrenic outpatients. In order to study the relationship of clinical responses and haloperidol levels in acute treatment, we measured steady-state plasma haloperidol levels and rated clinical response in 18 newly admitted, acutely psychotic schizophrenic inpatients.

Method

Eighteen actively psychotic patients newly admitted to the Fair Oaks Hospital Neuropsychiatric Evaluation Unit and diagnosed by Research Diagnostic Criteria (Spitzer et al. 1978) were included in this study. Fourteen had schizophrenia, undifferentiated or paranoid subtype, and four had schizoaffective disorder. All were treated with haloperidol. Mean age of these patients ± s.e.m. was 26 ± 1 years. The Brief Psychiatric Rating Scale (BPRS) (Overall & Gorham 1962) was done by a research psychiatrist at the time of admission and at regular intervals thereafter. Haloperidol dosage was adjusted by the treating psychiatrist based on standard clinical criteria. Dosage ranged from 7-60 mg daily. Anticholinergic medications were used as needed for extrapyramidal symptoms (EPS). Some patients received some of their haloperidol by intramuscular injection during the first week, but thereafter the medication was administered orally. Blood samples for assay of steady-state plasma haloperidol levels were obtained by venipuncture at regular intervals while patients were receiving haloperidol. Steady-state levels (Forsman & Ohmen 1976), were defined as those obtained at 8 a.m. in the morning 10 hours after the previous dosage of haloperidol in a patient who had been on the same dosage for at least 1 week. Plasma haloperidol levels were determined by gas-liquid chromatography (GLC) with nitrogen-phosphorus selective detection using a modification of the method of Bianchetti and Morselli (1978). The absolute sensitivity of the method was 1 ng/ml with a mean day-to-day coefficient of variation of less than 10 percent. Haloperidol responders were defined as patients showing a decrease of 10 points or more on the BPRS at a given time point. Data are expressed as mean ± s.e.m.

Results

The mean BPRS score on admission was 60 ± 2. Nine patients were responders to haloperidol at the end of 4 weeks. Mean decrease in BPRS at 4 weeks in these nine patients was 17 ± 3. Of these nine responders, seven had steady-state haloperidol in the therapeutic range suggested by the literature (Forsman & Ohmen 1976; Magliozzi et al. 1981) of 5-15 ng/ml, and two had higher levels. Mean plasma level in the nine patients identified as responders at 4 weeks was 15.6 ± 4.0 ng/ml. Dosage in these nine patients ranged from 10-60 mg daily, with a mean of 27 ± 5 mg daily. Three responders were dropped from the study before 4 weeks, because of severe extrapyramidal syndrome (EPS). All three of these responders had haloperidol levels in the 5-15 ng/ml range. Six patients were nonresponders. Four of these six were dropped from the study before 4 weeks because of poor response Three of these six nonresponders had haloperidol levels outside the 5-15 ng/ml range — two higher and one lower. Mean plasma level in the six nonresponders was 14.4 ± 4.1 ng/ml. Dosage in these six patients ranged from 7-60 mg daily, with a mean of 25 ± 9 mg daily. In summary, 10 of 12 responders but only 3 of 6 nonresponders had haloperidol levels in the 5-15 ng/ml range (*see* Table and Figure).

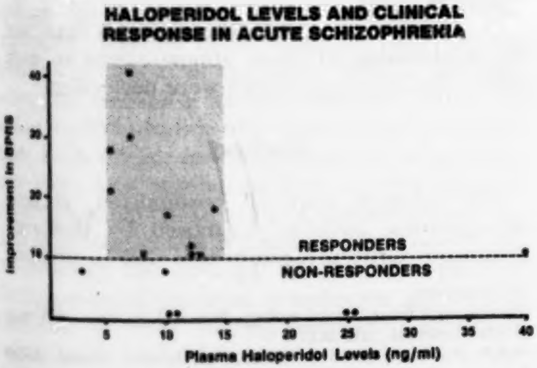
Table

Plasma Haloperidol Levels and Clinical Response in Acute Schizophrenia

	Plasma Haloperidol Levels	
	5-15 ng/ml	> 15 < 5 ng/ml
Responders	10	2
Nonresponders	3	3



FIGURE

There was a significant positive correlation between steady-state plasma haloperidol levels and dosage ($r = .68$, $p < .01$). There was no significant correlation between haloperidol levels and change in BPRS.

Discussion

These results suggest that a high proportion of acutely psychotic schizophrenic inpatients who respond to treatment with haloperidol do so at plasma levels in the range of 5-15 ng/ml. This is in basic agreement with a previous study showing outpatients to respond within this approximate range (Magliozzi et al. 1981). There are certain methodological limitations inherent in attempting to define a therapeutic window of plasma levels in an open clinical trial of a therapeutic agent. Dosage adjustments are partially dependent on clinical response, unlike a fixed-dose trial. Also, it is not certain that patients who respond within a given range of plasma levels would not respond at levels above or below this range. Nor is it certain that nonresponding patients would not respond at higher or lower levels. However, this study does identify a range of plasma levels within which most acute schizophrenic patients who respond to haloperidol will fall. There is certainly no linear relationship between haloperidol levels and clinical response. The results here are consistent with either a "therapeutic window" or a "threshold" for effective plasma levels of haloperidol in acute schizophrenia. Individual patient data suggest that nonresponders continue not to respond when haloperidol levels are increased above 15 ng/ml. For example, a 33-year-old woman was unimproved after 2 weeks on haloperidol 15-20 mg daily with plasma levels of 6.7-12.2 ng/ml. She showed no improvement when her haloperidol was raised to 60 mg daily with a plasma level of 25.0 ng/ml.

There are certain practical advantages to measuring plasma haloperidol levels. First, because haloperidol has no known significant active metabolites (Magliozzi et al. 1981), assay of haloperidol alone measures the pharmacologically active compound. Second, the GLC assay (Bianchetti & Morselli 1978) is adaptable to a large volume of clinical samples.

The results presented here, along with previous results from other investigations, suggest that measurement of plasma haloperidol levels may provide useful guidelines for adjusting medication dosage in schizophrenic patients. Most of the acutely psychotic schizophrenic patients reported here responded with plasma levels in the range of 5-15 ng/ml. Further research needs to be focused on better defining a possible "therapeutic window" or "threshold" for effective haloperidol levels in schizophrenic patients.

Abnormal Immune Regulation in Schizophrenic Patients

Lynn E. DeLisi, M.D.,[1] and Richard Jed Wyatt, M.D.[2]

Introduction

Associations between psychological states, disease susceptibility and immunity are well known (Stein et al. 1981). In addition, several published reports suggest that schizophrenic patients may have abnormal immune responsiveness and laboratory signs of altered immunity (reviewed by Wyatt et al. 1982) Lymphocyte populations from schizophrenic patients have been shown to contain histologically and functionally abnormal cells as well as abnormal proportions of lymphocyte subtypes (Fessel & Hirata-Hibi 1963; Hirata-Hibi et al. 1982; Kamp 1962; Vartanian et al. 1978). Alterations in plasma and cerebral spinal fluid (CSF) gamma globulin concentrations have also been found (Bock et al. 1970; Domino et al. 1975; Solomon et al. 1969; Strahelivitz et al. 1976; Torrey et al. 1978), as well as evidence of increased antinuclear antibody titres (Gallien et al. 1975; Johnson & Whaley 1975; Zarrabi et al. 1979). Furthermore, the incidence of various diseases known to be associated with immune abnormalities such as rheumatoid arthritis, cancer, asthma, and allergic reactions have been reported to be lower in schizophrenic patients compared with general populations (Baldwin 1979).

In a further attempt to examine this issue and the relationship of these abnormalities to each other, the following studies were performed.

Method

The subjects were all hospitalized, chronic schizophrenic patients diagnosed by Research Diagnostic Criteria (Spitzer et al. 1977), who had

little or no response to conventional treatment, and were residing on the research units of the National Institute of Mental Health, Saint Elizabeths Hospital, Washington, D.C.

Thirty-eight patients (mean age ± S.D. 35.0 ± 10.5) had blood drawn into heparinized plastic syringes on serial occasions for determination of the proportion of lymphocyte subpopulations (*see* Thaler et al. 1977, for review of the immune system). Seven patients were free of medication for at least 1 month; the remaining 31 were medicated on stabilized doses of neuroleptic medication. Forty-seven healthy volunteers (mean age ± S.D. 27.7 + 6.7) from nearby universities and the research laboratory served as controls. Monoclonal antibodies specific to antigens on the surface of T lymphocytes (Leu-1), B lymphocytes (HLA-DR), Suppressor T cells (Leu-2), and Helper T cells (Leu-3) and tagged with fluorescence (Becton-Dickinson Monoclonal Antibody source book), were employed in the following procedure: Lymphocytes were separated from whole blood by the method of Boyum (1968) on a ficoll gradient and centrifuged at 400 g for 50 minutes. The lymphocyte containing band was removed, washed with a buffer consisting of balanced salt solution (Hank's), 2 percent Bovine Serum Albumin (BSA), and .2 percent NaN_3 and spun at 200 g for 10 minutes, then resuspended in 10 ml of buffer and counted in a coulter counter. Cells were then resuspended at a concentration of 1×10^7 cells per cc. Five μl of either Leu-1, Leu-2, Leu-3, or HLA-DR (Becton-Dickinson) was added to 100 μl of cells and vortexed. The suspensions were incubated in the dark on ice for 45 minutes, then pelleted by spinning in an Eppendorf Centrifuge for 15 minutes. The supernatant was aspirated, washed once, and the pellet resuspended in 100 μl of the above buffer. Samples were run through a Becton-Dickinson FACS III using the 488 nM line of an argon laser for excitation. Each sample run (approximately 12 samples per day) was standardized to known chicken erythrocyte light scatter and fluorescence curves. The fluid stream was adjusted to a flow rate of approximately 200 cells per second. The percent fluroescence of the total lymphocyte population (percent of cells having receptors for each monoclonal antibody) was determined on the FACS. Split samples in the same day run had a 2 percent mean variation.

Twenty patients who had HLA-DR binding measured had concurrent plasma immunoglobulins (IgG, IgA, IgM) quantified using an immunofluorescent assay (Clinical Immunology Laboratories, Inc., Los Angeles, Cal.).

Additionally, a total of 51 chronic schizophrenic patients, including 26 of the patients who had lymphocyte subpopulation determinations plus 24 first-episode Diagnostic and Statistical Manual-III (DSM-III) schizophreniform-disordered patients, had serum antinuclear antibody titres determined by an indirect immunofluorescent technique at Clinical Immunology Laboratories. All patients with positive antinuclear antibody titres also had antinative DNA antibody and Histone reactive ANA titres determined (specific tests to diagnose Idiopathic Systemic Lupus Erythematosis and drug-induced Lupus, respectively; Fritzler & Tan 1978).

The schizophreniform patients were sampled prior to neuroleptic treatment over a 2-year period from acute psychiatric admission facilities in the Washington, D.C. area.

Results

Percentages of Leu-1 (total T cells), Leu-2 (Suppressor T cells), Leu-3 (Helper T cells), and HLA-DR (total B cells) are summarized in the Table. The patient group had significantly higher total T cell, as well as B cell, percentages than controls, although an in inverse relationship was suggested for B and T cell percentages for subjects in each group (for patients: Pearson $r = .61$, $p < .003$; for controls: $r = -.51$, $p < .07$). No significant differences were found when comparing the means of the medicated patients with the means of the nonmedicated patients.

B-cell percentages were significantly correlated with IgG plasma concentrations (Pearson $r = .52$, $p = .015$) while not correlated with IgA or IgM concentrations (Pearson $r = .33$; $p = .15$ and $r = -.01$; $p = .97$, respectively). Five of the 20 patients had IgG concentrations higher than the normal range; three of these five had additional elevations in IgA concentrations. One patient had an elevated IgM concentration and normal IgG and IgA, and one patient had an IgG concentration below the normal range. All normal ranges were those established by the Clinical Immunology Laboratories.

Table

Mean (± S.D.) Percent of Total Lymphocytes of Each Lymphocyte Subtype in Schizophrenic Patients vs. Controls

	Percent Leu-1 (Total T's)	Percent Leu-2 (Suppressor T's)	Percent Leu-3 (Helper T's)	Percent HLA-DR (Total B Cells)

p	.03	.03	.50	.008

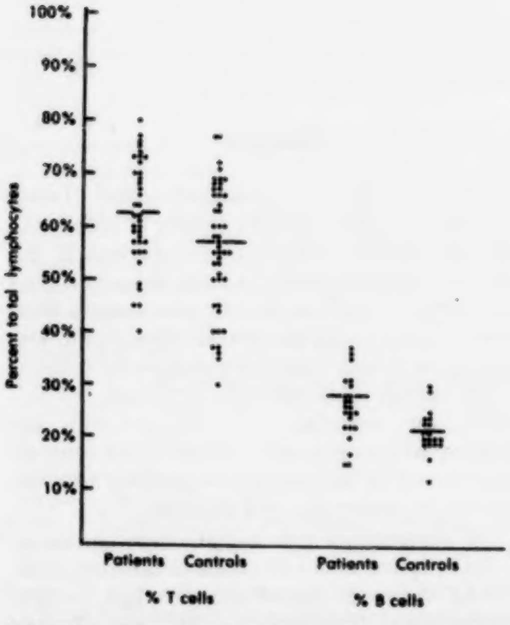

FIGURE 1. Scattergram of the percent HLA-DR binding (B cells) and Leu-1 binding (T-cells) to total lymphocytes in the schizophrenic patients compared with controls.

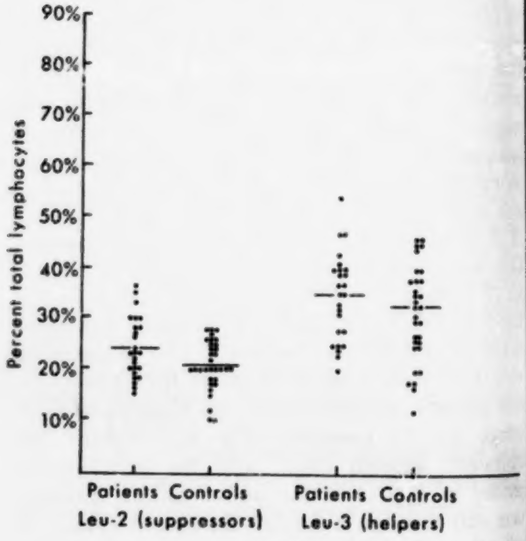

FIGURE 2. Scattergram of the percent Leu-2 (Suppres T cell) and Leu-3 (Helper T cell) binding to total lymphocytes in the schizophrenic patients compared wit controls.

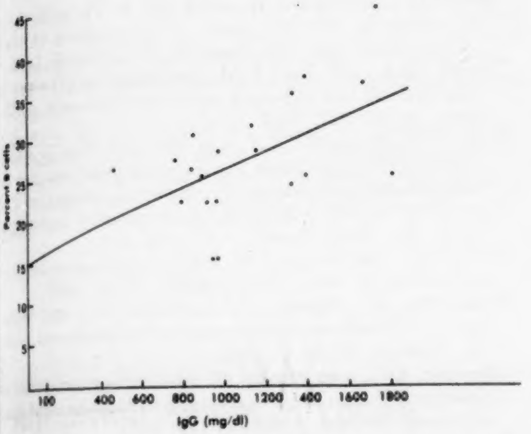

FIGURE 3. IgA concentration vs. percent B cells. Pearson $r = .53$. Mean percent B cells = 27.2 ± 7.2; mean IgG concentration = 1113.7 ± 356.

Antinuclear antibody titres were determined to be positive (> 1/10) of 21.7 percent of the chronic schizophrenic patients and 20.8 percent of the first-episode schizophrenic patients. It is known to be positive in 1-5 percent in the general population (Panush 1979). Positive antinuclear antibody titres did not correlate with elevated immunoglobulin concentrations or elevated proportions of B or T cells. None of the patients with positive antinuclear antibody titres had evidence of either antinative DNA antibodies or anti-Histone reactive DNA antibodies.

Discussion

The data presented here show small differences between schizophrenic and control populations in both the cellular and humoral immune systems. While a generalized decrease in the production of immunoglobulins among chronic schizophrenic patients had been previously found, (DeLisi et al. 1981), a subgroup of patients in the present study had elevated IgG concentrations that were correlated with elevated proportions of the lymphocyte subtype (B cells) that produces them.

These changes may be consistent with the notion that neuroleptic medications alter the immune response. All chronic schizophrenic patients studied had previously been under neuroleptic treatment for several years. That neuroleptics affect the immune system is supported by several lines of evidence. Chlorpromazine has been linked to the presence of abnormal lymphocytes in the blood of schizophrenic patients (Fieve et al. 1966) and the development of systemic lupus erythematosis (Ananth & Minn 1973; Dubois et al. 1972; Fessel & Solomon 1960), an immune complex disorder. Antinuclear antibodies have also been associated with long-term neuroleptic treatment (Gallien 1975; Johnstone & Whaley 1975; Zarrabi et al. 1979). Lovett et al. (1978) have reported a decrease in antibody production *in vitro* by B cells associated with chlorpromazine and Ferguson et al. (1978) reported a suppressive effect of chlorpromazine on several *in vitro* measures of T lymphocyte responsiveness. In addition, *in vivo* proportions of B and T lymphocytes have been shown to return to normal after discontinuation of neuroleptic medication (Ferguson et al. 1978; Liedeman & Prilipko 1978).

The increased proportions of B and T lymphocytes found in our studies, however, may not solely be a result of neuroleptic medication. The few medication-free patients in our studies did not have proportions of B and T cells different from the medicated patients and contrary to the Lovett et al. (1978) study, the increases in B cell percentages were associated with increased antibody production. Furthermore, a recently published report of histological abnormalities in lymphocytes of schizophrenic patients defines distinct abnormalities present in unmedicated chronic schizophrenic patients as well as first-episode acute schizophrenics (Hirata-Hibi et al. 1982).

Heath and Krupp (1966) have hypothesized that abnormal immunity in schizophrenic patients may be the result of an autoimmune disorder and reported the presence of antibrain antibodies in postmortem brain specimens from schizophrenic patients. The present study supports previous findings of a 20-25 percent incidence of positive antinuclear antibody titres that are not specific for lupus erythematosis in chronic schizophrenic patients (Gallien et al. 1975; Johnstone & Whaley 1975; Zarrabi et al. 1979). The increased antinuclear antibody titres in first-episode schizophrenic patients never medicated with neuroleptics, and the negative titres of antibodies characteristic of drug-induced lupus, suggest that this finding in chronic schizophrenic patients is not simply an effect of long-term medication. Further studies are necessary to determine if an autoimmune phenomena is related to the etiology of schizophrenia.

Torrey et al. (1978) have proposed a viral etiology to schizophrenia subsequent to their findings of specific increases in viral antibody titres. Chronic viral infection, in turn, may cause multiple alterations in immune response. We have not determined in the present studies whether increased viral antibody titres are associated with these abnormalities. Even if found, it would not be clear whether the increased viral antibody titres were associated with the pathology of the illness itself or a consequence of altered immunity.

Finally, the differences reported here are small. It is uncertain if these alterations in immune functioning are related to reported altered incidences of various autoimmune, infectious, and neoplastic disorders in schizophrenic populations.

Abnormal Scans in Young Schizophrenics

S. Charles Schulz, M.D.,[1] Miriam Koller, M.D.,[1] Pulla R. Kishore, M.D.,[1] Robert M. Hamer, Ph.D.,[1] and Robert O. Friedel, M.D.[1]

Introduction

Although brain abnormalities have been reported for years in the psychiatric literature, the use of the computed tomography (CT) scanner allowed investigators to assess the brain in some new ways. Johnstone et al. (1976) and Weinberger et al. (1979a) reported a difference in ventricular size between schizophrenic patients and control subjects. Since these reports have been published, a significant amount of research has appeared which has bolstered their significance. Correlations of neuropsychological tests such as the Halstead-Reitan Battery (Donnelly et al. 1980) and Luria-Nebraska Test (Golden et al. 1980) and CT scale abnormalities have been demonstrated. In addition, enlarged lateral ventricles in schizophrenic patients has been associated with poor response to antipsychotic agents when compared to schizophrenic patients with normal-sized ventricles (Weinberger et al. 1980). Increased sulcal size of the cerebral cortex (Weinberger et al. 1979b) and atrophy of the cerebellar vermis (Weinberger et al. 1979c) have also been noted.

In studies reported to date, the patients have usually been ill and have received treatment for some time. The investigators of the early reports hypothesized that the CT scan changes would probably be present early in the course of the illness because there was no correlation with increased ventricular brain ratio (VBR) or lenth of time since onset of symptoms (Weinberger et al. 1979a). The purpose of this investigation was to examine the CT scans of young schizophrenics, many of whom had not received neuroleptics.

Methods

The patients studied included all consecutive admissions diagnosed as schizophrenic (or schizophreniform) who were 22 years old or younger and had not been ill or treated with medication for more than 24 months. They included 10 males and 5 females (total $N = 15$) with average age of 17.1 years (range 15 to 22). They had been ill 13.7 (± 2.1 S.E.) months and treated for an average of 5.2 months. Ten had never received neuroleptics. No patients had significant medical illness or mental retardation.

The control group were selected at random by the neuroradiologist from CT scans read as normal. There average age was 16 (13 to 19).

The ventricular brain ratio (VBR) was obtained by planimetric measurement performed as described by Weinberger et al. (1979a). Results were analyzed by application to *t*-test after log transformation of the VBR measures to equalize the variances.

Results

The schizophrenic patients had a mean VBR of 8.3 ± 4.9 S.D. which was significantly larger than the control population whose mean VBR was 2.7 ± 2.35 S.D. ($p < .0001$).(Figure 1)

There was no correlation with the length of time since the onset of symptoms and VBR. (Figure 2)

When a standard of "normality" was constructed by adding two standard deviations to the mean of the control group, it was noted that 8/15 (53%) patients had "abnormal" VBRs. Even when compared to adult standards of abnormality (VBR > 10), 7/15 were judged to be large.

---

[1] Medical College of Virginia, Richmond, VA 23298.

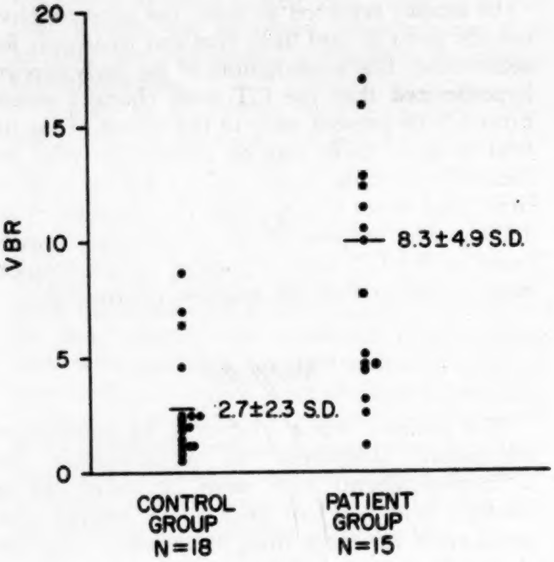

FIGURE 1.

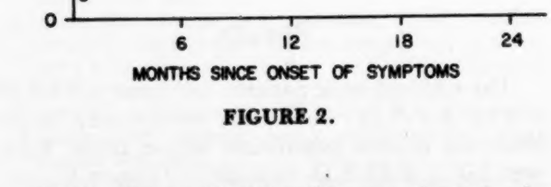

FIGURE 2.

Of the three schizophreniform patients in the study, one had an abnormal scan (VBR = 10). No tumors were seen in this series.

Conclusion

These results corroborate the finding of increased VBR in schizophrenic patients and are comparable in magnitude to Weinberger's initial report. This finding is consistent with the hypothesis that the CT scan abnormality is present early in the illness and is not a result of treatment with medication or institutionalization.

Although the prevalance of the increased VBR was about 50 percent in the authors' group of patients, this may not be an accurate assessment of the rate of abnormality in all young schizophrenics, as the Medical College of Virginia is a tertiary referral center.

There are other parameters concerning these patients that are currently being evaluated.

Computer EEG Drug Data Base in Psychopharmacology and in Drug Development

Turan M. Itil, M.D.,[1] Gopi N. Menon, M.D.,[2] and Kurt Z. Itil, B.A.[3]

The quantification of human electroencephalogram (EEG) with a digital computer, called computer-analyzed EEG (CEEG™) (Itil 1974), is the only objective method in the development of new psychotropic drugs in humans. The method was developed based on a series of observations and hypotheses.

One of these observations has been that all drugs that are effective on human behavior (psychotropic drugs) also produce changes in human brain function, which can be established by scalp recorded EEG. Some of the psychotropic drug-induced changes in EEG are relatively minimal and therefore difficult to evaluate visually. Thus, it is imperative that the EEG be quantified. The most advanced quantifications of EEG are via specific-purpose computers. Although it is recorded with similar equipment, and the recorded activities on paper are the same, the computer-analyzed EEG for psychotropic drug development is distinctly different from neurologically used "conventional" EEGs for clinical diagnosis. Whereas a "conventional" EEG is primarily concerned with very slow waves (less than 7 cps) and "abnormal" waveforms such as sharp waves, spikes, spikes and waves, focal abnormalities, and paroxysmal activities, the CEEG™ for psychopharmacology is primarily concerned with "normal" waveforms, and normal frequency (alpha, beta, and faster activities) and amplitude distributions. Only 3 of the 22 measurements of a CEEG™ (period analysis) are used in a conventional "clinical" EEG. The remainder of the 19 measurements are not considered in the conventional electroencephalography for the purpose of clinical diagnosis, although they are important in psychopharmacology. Therefore, in order to differentiate from the conventional EEG, the computer-analyzed EEG was termed "computer-analyzed bio-electrical potentials" (CABP) or "computerized EEG" (CEEG™) by Itil (1974) or cerebral electrometry by Fink (1974).

CEEG™ is most successfully applied during Phase I "safety" clinical pharmacology trials and Phase II psychotropic drug studies using the methods of quantitative pharmaco-EEG (QPEEG™) (Itil 1974; Itil et al. 1971). QPEEG™ is the method involving the use of digital computer-analyzed EEG and a series of statistical procedures for the establishment of the mode of action of a new compound in humans after an orally administered single dose. More specifically, this method can help to:

A. Determine the potency (quantity) of *central nervous system (CNS)* effects;

B. Estimate the *onset and duration* of the CNS effects;

C. Predict clinical usefulness *(psychotropic properties)* of new drugs.

Until recently, the CEEG™ drug classification system was subjective. Classification was made based on "visual inspection" of CEEG™ profiles of a compound. More recently, the technique has become automated and objective. In the past ten years, the CEEG™ profiles of a variety of marketed psychotropic drugs were obtained in standard trials using the QPEEG™ method. These data have recently been reanalyzed using both period analysis and EEG power spectral density analysis programs, and stored in a data base format in a minicomputer. The HZI Research Center computer data base includes the CEEG™ effects of 105 clinically well-known psychotropic compounds in 810 male and female volunteer subjects in the age range of 21 to 35, collected in 92 QPEEG™ studies. When a new drug is studied, first its CEEG™ profile is obtained based on a QPEEG™ trial. Subsequently, the CEEG™ profiles of this compound are compared with the CEEG™ profiles of data base psychotropic drugs using correlation statistics to classify the new drug.

Replicability, reliability, and validity of the HZI computer data base to classify psychotropic drugs were tested in a series of studies (Itil et al. 1981). It was established that the computer data base is able to classify the marketed anxiolytics, psychostimulants, and antidepressants statistically significantly better than chance ($p < .00001$ for anxiolytics, $p < .00001$ for psychostimulants, and $p < .0001$ for antidepressants; binomial statistics). Classification of marketed neuroleptics was not better than chance, in part because the doses of neuroleptics administered in these studies were less than those used for therapeutic purposes in clinical practice.

Investigations in recent years have demonstrated (Itil et al. 1977, 1979, 1980) that application of the CEEG™ and a computer EEG drug data base are helpful not only in *quantitatively determining* the central nervous system (CNS) effects of drugs as well as the lowest CNS effective dose and *predicting psychotropic properties* of compounds, but also in predicting *psychotropic potency* and the *lowest psychotropic effective single dose* of a new compound using QPEEG™ methodology.

In this paper the use of CEEG™ will be presented in a series of Phase I single-dose tolerance and safety studies.

QPEEG™ Studies

Etizolam*

ETIZOLAM (Y-7131) [6-(o-Chlorophenyl)-8-ethyl-1-methyl-4H-s-triazolo (3,4-c) thierno(2,3-e) (1,4)diazepine] is a new derivative of the thienodiazepines and has biochemical profiles similar to diazepam, but differs from it in exhibiting an inhibitory effect on the NE turnover and its uptake; thus, antidepressant effects of etizolam were also predicted.

A double-blind crossover QPEEG™ study with latin-square design was conducted in 10 healthy male and female volunteers. Etizolam was orally administered in single doses of 0.5 mg, 1 mg, and 2 mg. Control compounds were 5 mg diazepam, and placebo. CEEG™ recordings were done pre, 1,3, and 6 hours after drug. The results were as follows:

1 - CNS effects of all dosages of etizolam and 5 mg diazepam could be discriminated (multivariate randomized T^2) from placebo at the statistical level ($p = .05 - .002$). Therefore, the lowest CNS effective dose of etizolam was established as 0.5 mg. Etizolam also produced statistically significant dose- and time-related CNS effects.

2 - The mode of action of etizolam resembled that of benzodiazepine anxiolytics. The HZI Research Center computer drug data base classified all doses of etizolam as anxiolytic (Figure 1). The similarity coefficient with data base anxiolytics was for 0.5 mg etizolam = .7 (mean), for 1 mg = .79, for 2 mg = .90. The control compound (5 mg diazepam) was also classified as anxiolytic, which indicated that the data collection and analysis systems were accurate and the subjects adequately responded to an anxiolytic. Based on a two-dimensional drug classification system, it was demonstrated that the CNS effects of etizolam, next to anxiolytics, showed greater similarity to tricyclic antidepressants than those of diazepam (similarity coefficient was .82).

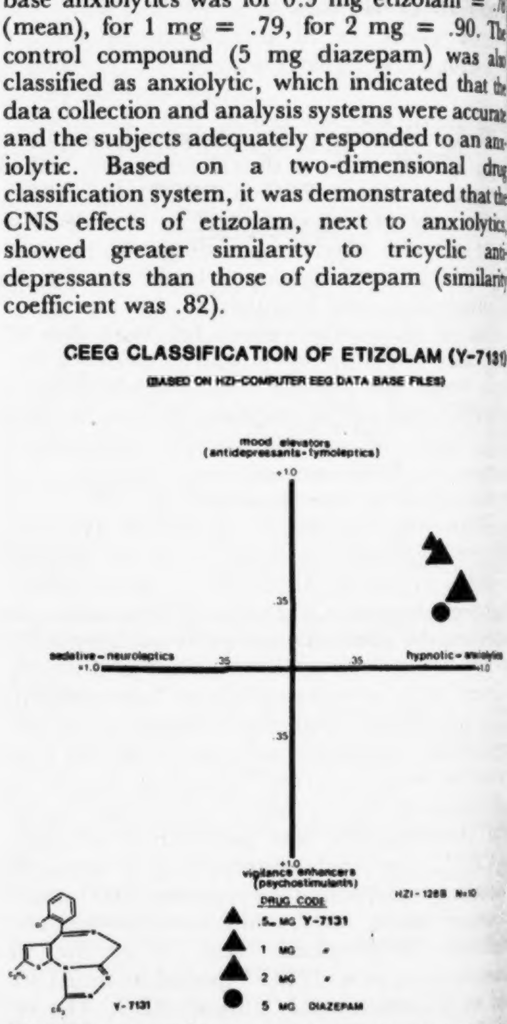

FIGURE 1. According to a two-dimensional classificati system (based on the two highest similarity coeffici with computer data base drug groups), all doses etizolam and diazepam were classified primarily hypnotic-anxiolytic and secondarily as antidepres (mood elevator). The highest hypnotic-anxiolytic prop ty was seen with 2 mg etizolam and the lowest with 0.5 etizolam; particularly the lower doses showed more elevator effects than that of diazepam.

---

*Yoshitomi Pharmaceutical Industries Ltd., Osaka 540-91, Japan.

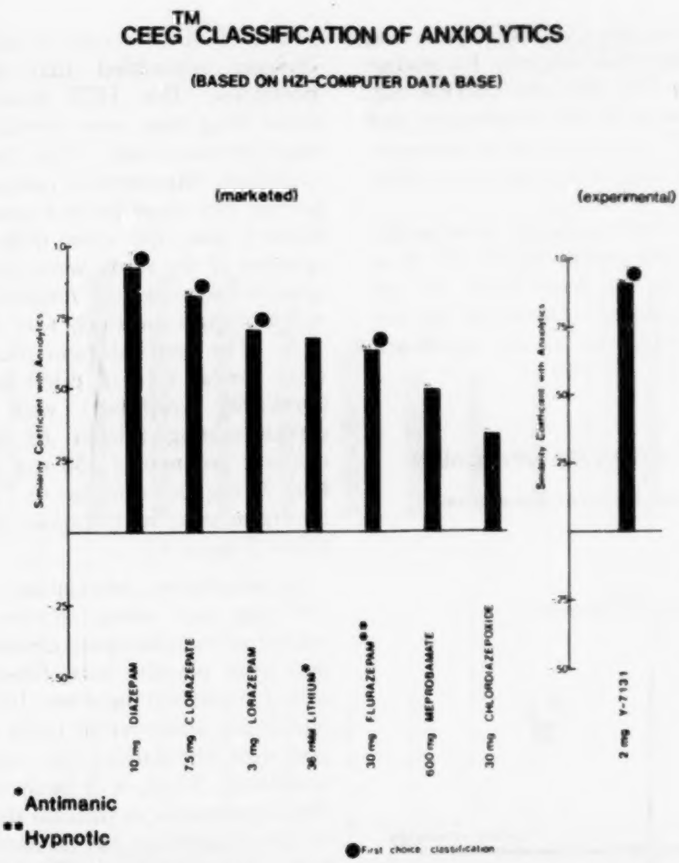

FIGURE 2. Among the marketed anxiolytics, diazepam showed the highest similarity coefficient with data base anxiolytics, and chlordiazepoxide the lowest; etizolam's (2 mg) similarity coefficient was slightly less than that of 10 mg diazepam.

3 - The anxiolytic potency of etizolam with 2 mg was slightly less than 10 mg diazepam but more than 7.5 clorazepate and 3 mg lorazepam (Figure 2).

4 - The minimum psychotropic effective single dose of etizolam probably starts lower than the minimum dose (0.5 mg) administered in this study.

In conclusion, it was established that etizolam is a very potent CNS effective compound with a significant effect on the CNS system at 0.5 mg or even lower. Its mode of action is similar to those of benzodiazepine hypnotic-anxiolytics. Thus, it is predicted to be effective in anxiety patients. The hypnotic-anxiolytic potency of 2 mg etizolam was found to be just slightly less than 10 mg diazepam. In clinical trials, the use of a 0.5 mg single dose is recommended.

Binodaline

BINODALINE (Sgd - Scha 1059)*. (1-[W-dimethylaminoethyl-methyl]-amino-3-phenyl-indole hydrochloride) is a compound with mood elevating properties similar to imipramine but stronger than amitriptyline, dibenzepin, and dimethacrine. It has neither monoamine oxidase-inhibiting properties nor anticholinergic activity. It has been shown to be devoid of serious toxic effects in animal toxicological studies.

---

*Siegfried AG, Zofingen, Switzerland.

pages tightly bound

A double-blind crossover QPEEG™ study was conducted in 10 healthy male subjects. Binodaline was used in four doses 150, 300, 450, and 600 mg. Control compounds were 50 mg imipramine, and placebo. The CEEG™ recordings were done pre, 1,3, and 6 hours after drug or placebo administration. The results were as follows:

1 - The CNS effects of binodaline could be discriminated (multivariate randomized T^2) from placebo in 300 and 600 mg doses (p = .01 and .05, respectively). However, binodaline did not produce any appreciable statistically significant dose- and time-related CNS effects.

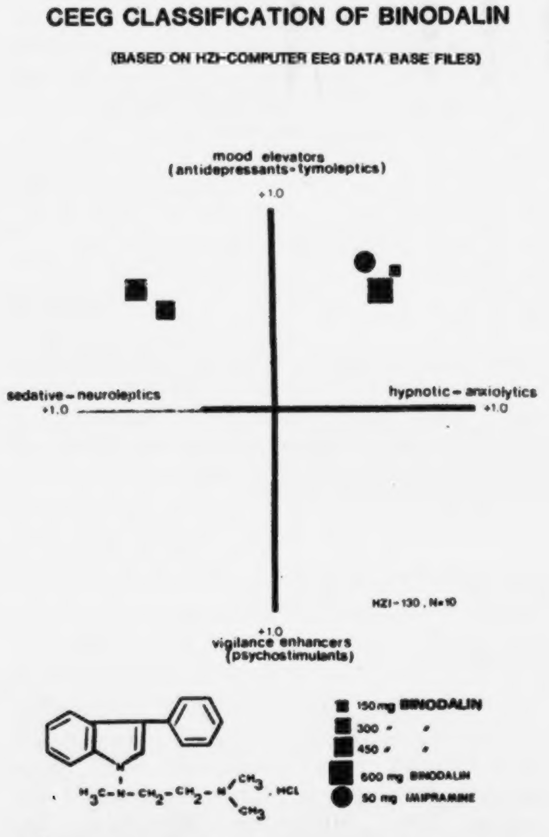

FIGURE 3. Based on the two-dimensional classification system, all dosages of binodaline were classified primarily as mood elevator, whereas 150 and 600 mg also showed hypnotic-anxiolytic properties, and 300 and 450 mg showed secondary sedative-neuroleptic effects. Imipramine was classified primarily as mood elevator and secondarily as hypnotic-anxiolytic.

2 - Mode of action of binodaline in all four dosages resembled that of tricyclic antidepressants. The HZI Research Center computer drug data base classified all dosages as a mood elevator with a first choice (Figure 3). Imipramine, the control compound, was, as expected, also classified as a mood elevator. This indicated that the data collection and analysis systems of the study were reliable, subjects adequately and accurately responded to a known mood elevator, and the study was therefore valid.

3 - The mood elevator potencies of binodaline were similar to each other in all dosages tested (similarity coefficient with data base mood elevators ranged from .64 to .77). The mood elevator potency of 150 mg binodaline was less than 75 mg amitriptyline or 75 mg imipramine or 30 mg mianserin, but more than 75 mg nortriptyline (Figure 4).

In conclusion, binodaline, in doses as low as 150 mg, has mood elevator-like CNS effects similar to tricyclic mood elevators. Its discrimination from placebo was, however, possible only with 300 and 600 mg doses. It did not produce any significant dose-related CNS effects. These suggest that binodaline may have high biological variability. Thus, it is likely to have therapeutic effects primarily in selected depressed patients.

Oxiracetam*

OXIRACETAM (ISF-2522)(4-hydroxy-2-oxo-1-pyrrolidinacestamide) is a gaba-gabob derivative similar to piracetam, and was found to be active on both some behavioral tests and brain biochemical parameters indicative for improvement of learning and memory (Pifferi et al. 1976). Based on animal toxicological data, it was predicted that oxiracetam can be administered in humans up to 2400 mg single dose without any serious side effects.

A single rising dose tolerance and efficacy study was conducted with oxiracetam in seven healthy subjects using a QPEEG™ study design. Five dosages of oxiracetam (200, 400, 800, 1200, and 2400 mg) were administered with randomized control compounds (15 mg dextroamphetamine, 1200 mg piracetam, placebo). The results were as follows:

---

*ISF S.p.A.-Milano, Italy.

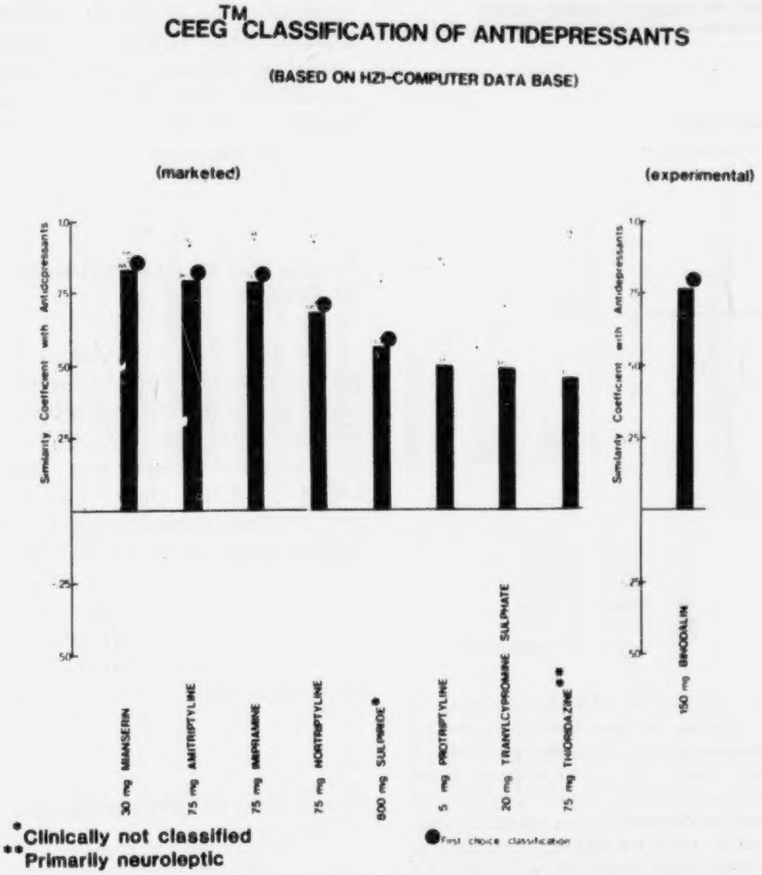

FIGURE 4. Among the marketed mood elevators, mianserin showed the highest, and thioridazine the lowest similarity coefficient with data base mood elevators. In this dose the mood-elevating properties of binodaline were less than mianserin (30 mg), amitriptyline (75 mg), and imipramine (75 mg), but more than nortriptyline (75 mg).

1 - The CNS effects of oxiracetam could be discriminated (univariate statistics) from placebo in dosages of 1200 and 2400 mg. Certain CEEG™ measurements indicated dose and time-related CNS effects of oxiracetam (regression analysis).

2 - The mode of action of oxiracetam on brain function is similar to that of vigilance-enhancing ("psychostimulant") compounds. The HZI Research Center computer drug data base classified oxiracetam in doses of 1200 mg (third choice) and 2400 mg (first choice) as a vigilance enhancing compound similar to 1200 mg piracetam and 15 mg dextroamphetamine (Figure 5).

3 - Based on the comparison of the similarity coefficients of oxiracetam with those of marketed vigilance enhancing compounds, it was predicted that 2400 mg oxiracetam would have vigilance enhancing effects which are less than 20 mg dextroamphetamine but more than 200 mg caffeine or 1200 mg piracetam (Figure 6).

4 - The lowest clinically therapeutic single dose of oxiracetam, which is safe and CNS effective, was predicted to be 1200 mg.

A double-blind clinical trial confirmed the CEEG™ prediction. Oxiracetam is effective in the improvement of memory, similar to piracetam, in daily doses of 2400 mg (Itil et al. in press).

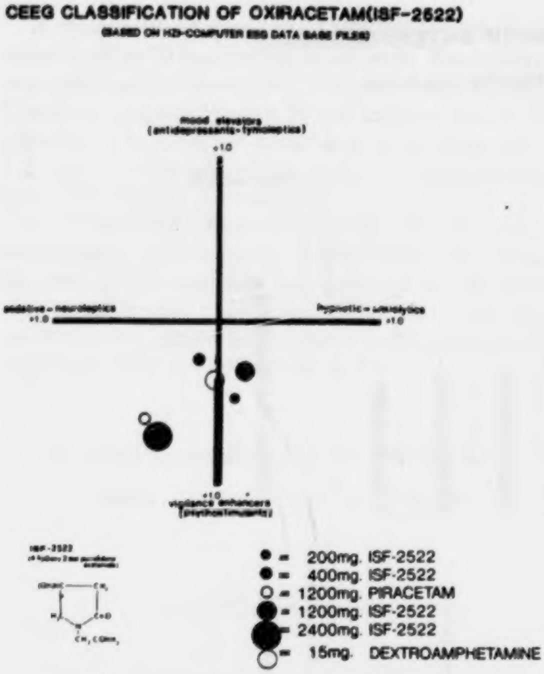

FIGURE 5. CEEG™ profiles of different dosages of ISF-2522 and control compounds were classified based on the HZI Research Center computer drug data base using a two-dimensional model. Correlation coefficients are based on the four recording conditions (1 hr and 3 hr RR and RT recordings), Dextroamphetamine was classified only as a vigilance enhancer, with no positive correlations with other drug groups. Four hundred and 2400 mg ISF-2522 and piracetam were classified between vigilance enhancers and sedative-neuroleptics, whereas 200 mg ISF-2522 and 1200 mg ISF-2522 were classified between vigilance enhancers and hypnotic-anxiolytics.

Conclusion

The use of CEEG™ in early drug screening (Phase 1) in man using QPEEG™ methodology and a computer EEG data base of established drugs is useful for the following:

Establishment of CNS Efficacy of Drugs

All clinically useful psychotropic drugs possess significant effects on human brain function, as established by computer analyzed scalp recorde human EEG (CEEG™). Accordingly, to be useful psychotropic, a new compound must ha significant CNS effects. This can be determine by discrimination of the CEEG™ effects of a dru from placebo, and by establishing dose and tim related CNS effects.

Prediction of Psychotropic Properties of Drugs

The HZI Research Center drug data base ca predict psychotropic properties of drugs afte single oral dose administration. The validity and reliability of the HZI data base to classify psychotropic drugs was successfully tested. CEEG™ drug data base classification of psychotropic properties can be independent of the animal pharmacology and biochemical properties or chemical structures of drugs. This was demonstrated through the discovery of psychotropic properties of drugs via CEEG™, which did not possess the "typical" pharmacological action of marketed psychotropics (It 1981).

Prediction of "Psychotropic Potency" of Drugs

It was established that the clinically most poten drugs also produce the most "typical" CEEG™ profiles, which show the highest similarity coefficient with the data base drugs.

Prediction of "Psychotropic Effective" Dos

The classification of the CEEG™ profiles of different doses of well-known drugs demonstrated that the minimum single dose, tolerable in man, and can be discriminated from placebo, and i classified by the HZI data base as psychotropic, i also similar to the clinically therapeutically effective single three times a day (t.i.d.) or four times a day (q.i.d.) dose (Figure 7).

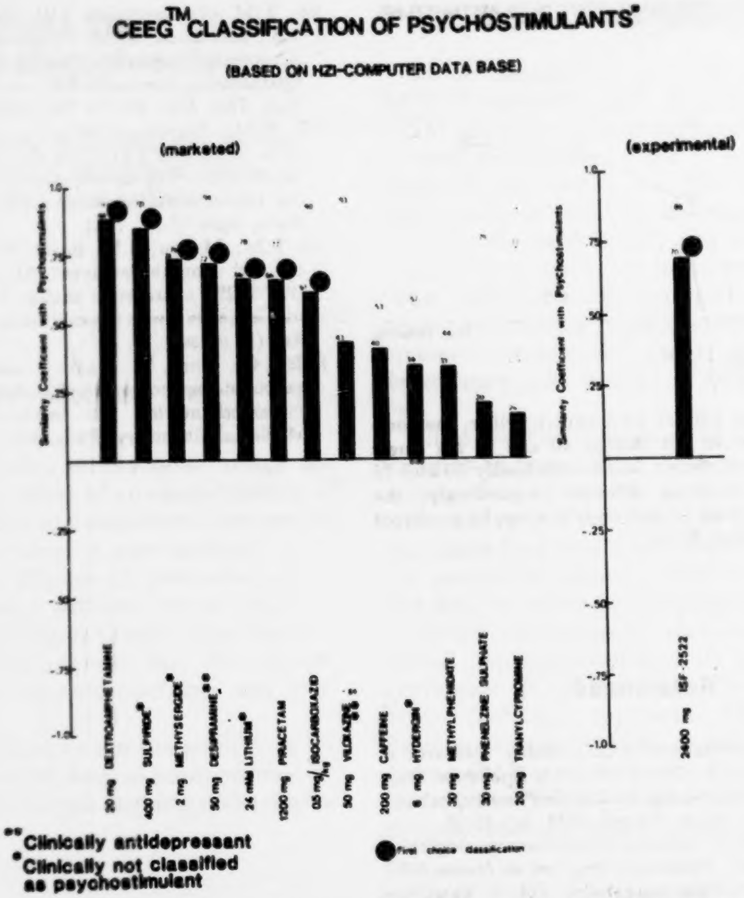

FIGURE 6. Of the marketed compounds which have some vigilance-enhancing properties, dextroamphetamine showed the highest, and tranylcypromine the lowest similarity coefficient with data base vigilance enhancers. Oxiracetam (2400) mg) has less vigilance-enhancing properties than 20 mg dextroamphetamine but more than 200 mg caffeine.

If a drug has significant CNS effects (discrimination from placebo) but cannot be classified by the data base, it is hypothesized that this compound has a different mode of action from existing major psychotropic drug groups (hypnotic-anxiolytics, mood elevators, sedative-neuroleptics, and vigilance enhancers); thus, it will have a new type of psychotropic property. On the other hand, if a drug is classified by the computer data base but cannot be discriminated from placebo, it is assumed either the dose studied is low, or sample size too small, or biological variability of this compound is too high; thus, this compound will not be a broad spectrum, effective psychotropic.

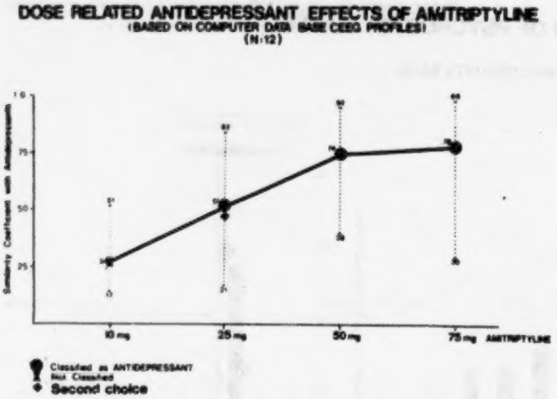

FIGURE 7. In our studies with amitriptyline, the computer data base could not classify 10 and 25 mg single dosages, with a first choice, but could classify 50 and 75 mg dosages as a mood elevator. Accordingly, the therapeutic single dose of amitriptyline can be predicted to be between 25 and 50 mg.

The First Clinical Study of BW-234U in Schizophrenia

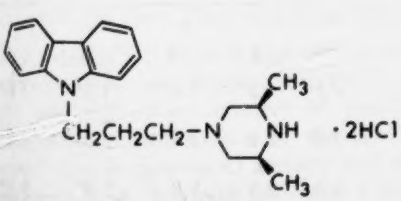
Jonathan Davidson, M.D.,[2] Robert Miller, M.D., Ph.D.,[1,2] Martha Wingfield, M.D.,[1,3] William Zung, M.D.,[2] and Anthony T. Dren, Ph.D.[4]

Introduction

Currently available antipsychotic drugs are associated with a number of unwanted effects, of which extrapyramidal and autonomic changes are particularly troublesome. A new carbazole compound, BW-234U, (Figure 1), promises to have antipsychotic activity without concomitant extrapyramidal or autonomic change. The results of testing BW-234U in animals, and the relevant underlying models, are presented elsewhere (Ferris et al. 1982).

This report describes an interim analysis in the first clinical study of the drug in schizophrenic inpatients; this study was still ongoing at the time of the report.

BW 234U



cis-9-[3-(3,5-Dimethyl-1-piperazinyl)propyl]carbazole dihydrochloride

FIGURE 1

Method

To be included in the study patients had to fulfill Diagnostic and Statistical Manual-III (DSM-III) criteria for schizophrenia, give informed consent, be between 18 and 55 years of age, be in good physical health, and have clinically acceptable values on SMA12, hematology, urinalysis, electrocardiograph (ECG), and electroencephalograph (EEG). Excluded from the study were patients with medically unstable illness, organic brain syndrome, mental retardation, blood pressure outside the range of 150/90, drug dependency, and women of childbearing potential.

All patients were assigned to receive BW-234U for up to 28 days. When the study was initiated, a starting dose of 100-200 mg/day was used, to be increased up to a maximum of 600 mg/day. This maximum limit was later reduced to 400 mg after one patient developed a seizure. Dosing, which was flexible, was administered on a b.i.d. basis.

Weekly assessments included the Clinical Global Impressions of Severity (CGI-S) and Improvement (CGI-I), Brief Psychiatric Rating Scale (BPRS), Inpatient Multidimensional Psychiatric Scale (IMPS), as well as the Simpson-Angus (SA) and Abnormal Involuntary Movement Scale (AIMS) scales which measured extrapyramidal and other movement disorder.

Results

Twelve patients entered the study, one dropping out within a week for family reasons unrelated to treatment. Eleven patients completed a minimum 3-week treatment and nine completed 4 weeks. One terminated treatment at 3 weeks because of a seizure, and the other recovered and was discharged. Baseline demographic data showed that all patients were male, eight were white and three black, mean age was 27.1 years (range 18 to 42). Ten patients were unmarried and one was separated. Using DSM-III subtypes, six patients had paranoid schizophrenia, four, chronic undifferentiated, and one, disorganized schizophrenia.

Mean doses at each weekly assessment were as follows: 295, 327, 363, and 344 mg/day. The median doses at each time were 300, 300, 400, and 300 mg.

FIGURE 4

Efficacy Scales

As shown in Figure 2, Global Severity of Illness decreased at each week from a baseline score of 5.3 to 3.8 by Week 4. This change was statistically significant at Weeks 2, 3, and 4. Overall improvement on the CGI-I was also noted.

The total BPRS score declined from 45.2 before treatment to 33.5 at Week 4 (Figure 3). Improvement was significant relative to baseline at all time points. Examination of the BPRS factors showed that symptoms of anxiety and depression responded first, followed at Week 2 by anergia, and at Week 3 by improvement on thought disorder, hostility, and suspiciousness.

Use of the IMPS (Figure 4) at pretreatment and termination showed a significant improvement on paranoid projection, perceptual distortion, anxious intropunitiveness, and on the total score.

Safety Data

No changes were noted on the SA and AIMS scales (Figure 5), consistent with the original expectation that this drug has few extrapyramidal side effects. The scores noted on the SA scale are similar to that found with placebo (Simpson & Angus 1971).

Clinical chemistry and hematology were performed weekly. Modest elevations of alkaline phosphatase (three patients), SGOT (four patients), and LDH (four patients) were noted. These gradually returned to normal after the drug was discontinued, or other neuroleptics substituted.

No significant changes were observed on blood pressure, pulse, weight, ECG, or EEG.

A number of adverse events noted in the study were judged to be drug related. These were as follows (number of patients in parentheses): seizure (1), fatigue (3), sleepiness (3), nausea (2), tremor (1), headache (1), insomnia (1), anorexia (1), diarrhea (1), gas (1).

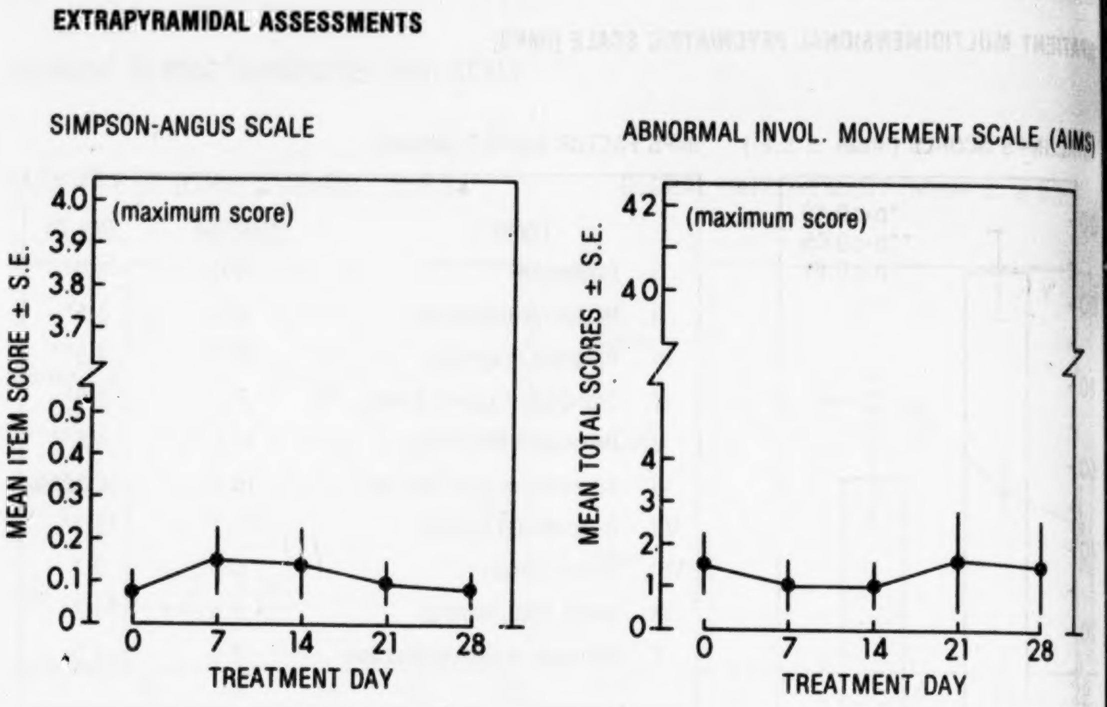

FIGURE 5

Summary

BW-234U is a well-tolerated antipsychotic agent in this acute schizophrenic population and has a low potential for inducing extrapyramidal or autonomic side effects. The efficacy which was seen needs to be confirmed by further controlled studies. The full dose range of this drug has yet to be determined.

Does Long-Acting Injectable Neuroleptic Protect Against Tardive Dyskinesia?

Solomon C. Goldberg, Ph.D.[1] Ramakrishnan S. Shenoy, M.D.,[1] Demetrios Julius, M.D.,[1] Robert M. Hamer, Ph.D.,[1] Beverly Ross, M.S.N.,[1] Teena Minton, R.N.,[1] and Marilyn Spiro, B.A.[1]

In an earlier study (Shenoy et al. 1981) of 34 chronic ambulatory schizophrenics who were maintained with fluphenazine decanoate for at least 2 years, an unusually low level of tardive dyskinesia was discovered compared to comparable patients reported in the literature. If anybody should have tardive dyskinesia, these patients should. It occurred to the authors that the patients might be suffering from a form of covert tardive dyskinesia that would become manifest only if medications were withdrawn. Since one major purpose of that study was to determine the effects on symptom status and tardive dyskinesia of discontinuation of drug therapy, there was the opportunity to see whether patients who initially showed no tardive dyskinesia would manifest any after being withdrawn from medication. Half the patients were randomly discontinued for a period of 6 weeks. Within that period, there was essentially no change in the level of tardive dyskinesia, either in the group that continued on medication or the random group that was withdrawn. Tardive dyskinesia was assessed by means of the Abnormal Involuntary Movements Scale (AIMS), a commonly employed instrument for this purpose. Inter-rater reliability was shown to be substantial.

That group of chronic ambulatory patients maintained on fluphenazine decanoate is part of a larger group of like patients who are maintained on a variety of oral neuroleptics. The patients on the long-acting injectable medication had been assigned to it years earlier because there had been problems in medication compliance with oral medication.

The obvious next step was to determine the level of dyskinesia in the larger group of patients on oral medication. If they showed the same low level, the results would be consistent, but puzzling. If they showed a higher level of tardive dyskinesia, the results would imply a protective or ameliorative mechanism in the injectable form of the medication.

Patients

The patients were 76 primarily male chronic ambulatory schizphrenic patients who were maintained on a variety of oral neuroleptics for at least the past 2 years. Patients whose medications included antidepressants or lithium were not included in this sample. These patients lived in the community even though they occasionally manifested a moderate level of schizophrenic symptomatology. The patients had had multiple prior hospitalizations for schizophrenic episodes, even after being placed on maintenance medication.

Assessment of Tardive Dyskinesia

Symptoms of tardive dyskinesia were assessed by means of the Abnormal Involuntary Movements Scale (AIMS) developed for this purpose by the Psychopharmacology Research Branch of the National Institute of Mental Health (1975). Although the words "tardive dyskinesia" are not employed in the scale itself, the particular movements the observer has to record are those that have been identified in the literature pertaining to tardive dyskinesia in contrast to extrapyramidal side effects such as fine tremors, gross dystonic reactions, cogwheel rigidity, and akathisia. After a period of orientation and practice on nonstudy patients, the 76 patients were observed for tardive dyskinesia by one of three rating team pairs. Each rating team saw only a portion of the 76 patients.

Results

Reliability of Measurement

In observing the patients for tardive dyskinesia, one member of the rating team took the responsibility for conducting the procedure and asking questions, while both members of the team rated the patient simultaneously. Rating team members would alternate conducting the examination. Immediately after a patient was rated, there was a postmortem comparison of the ratings given, but no changes were allowed to be made even if there were differences. Discussion of rating differences served as continuing training in the procedure and would hopefully have a beneficial effect on greater reliability on the subsequent occasions. Under these conditions, the rater agreement reliability by means of an intraclass correlation was .83 for global severity of tardive dyskinesia; for the sum of the seven specific items, intraclass correlation was .91. These levels of rater agreement compare favorably with those obtained on ratings of psychopathology.

Oral versus Depot Medication Maintenance on Tardive Dyskinesia

The Table shows the percent distribution of each item on the AIMS for the two medication groups. There is very obviously a greater prevalence of tardive dyskinesia in the group maintained on oral medications than in the group maintained on fluphenazine decanoate. The size of the significant differences in descending order are: a) tongue, b) face muscles, c) jaw, and d) eyes and perioral area. Nonsignificant differences were found for a) arms, wrists, hands, and fingers ($p = .089$) and b) legs, knees, ankles, and toes ($p = .26$).

Both age and duration of treatment were correlated with tardive dyskinesia. When entered as covarates, they reduced but did not eliminate the significant difference between medication groups. Measures of organicity in these patients were not available as another measure of risk for tardive dyskinesia.

Discussion

The results imply either that fluphenazine decanoate reduces the level of tardive dyskinesia if it is present, or protects against its development if not present.

If it is true that fluphenazine decanoate is le productive of tardive dyskinesia, what might the possible mechanism of action be? Baldessarin and Tarsy (1978) cite evidence supporting the interpretation that tardive dyskinesia "is associated with a state of relative dopaminergic overactivi or supersensitivity." This would account for worsening on withdrawal of dopamine-antagonistic neuroleptic drugs and worsening on administration of L-DOPA. Tune et al. (1980) found lower steady-state blood levels in patients who are maintained on long-acting injectable medication. It may then be that the oral medication is providing a higher steady-state blood level than is therapeutically required, bombards the post-synaptic receptors, and renders them "supersensitive." Tune et al. did not show a link between blood level and tardive dyskinesia, which now becomes a next obvious next step in research.

From a practical clinical point of view, the authors are not yet in a position to conclude that switching to the injectable form will reduce tardive dyskinesia. It is conceivable that the depot neuroleptic protects against the development of tardive dyskinesia if not present; but once tardive dyskinesia does become apparent, it may be persistent and hence may not be affected by switching to another form of medication. While the foregoing is possible, it is not a certainty, and the first and easier procedure to try on a patient with tardive dyskinesia would be a change to the long acting form. In the context of a formal study, this would be done by randomly assigning a group with tardive dyskinesia who are being maintained on oral medication to a) either continuing on the oral, or b) changing to the long-acting form However, for those practitioners who are not in position to undertake formal research, they have nothing to lose by trying on an open, informa basis a change to long-acting medication in those patients suffering from moderate to severe tardive dyskinesia.

Combined MAOI-Tricylic Antidepressant Treatment: A Controlled Trial

Kerrin White, M.D.,[1] Javad Razani, M.D.,[1] George Simpson, M.D.,[1] Ronald Rebal, M.D.,[1] R. Bruce Sloane, M.D.,[1] Judith O'Leary, M.A.,[1] and Ruby Palmer, R.N., M.A.[1]

The practice of combining monoamine oxidase inhibitor (MAOI) and tricyclic (TCA) antidepressants in treatment has been a source of controversy for nearly two decades. Case reports of severe reactions such as hyperthermic crises, delirium, and seizures led to widespread warnings against concurrent use of MAOIs and TCAs. However, reviewers raised many questions about these case reports, and uncontrolled clinical series on these treatments suggested both reasonable safety and unusually potent antidepressant effects. Until the past few years, no controlled clinical trials had been reported on these questions. The present study represents only the second such trial to use both double-blind methodology and random assignment to treatments.

This study was designed to assess whether combined treatment with tranylcypromine (TCP) and amitriptyline (AMI) has any pronounced advantages or disadvantages compared with single drugs used alone on a relatively heterogeneous group of depressed patients. The combined treatment followed an approach recommended by many clinicians who have used MAOIs and TCAs together: 1) first allowing a drug-free interval of at least 1 week; 2) then starting both drugs together, within the same day, at low dosage; 3) then gradually increasing dosage of both drugs together, to a maximum of half the dosage used with each single drug. This approach was compared with treatments involving the single drugs used alone at full dosage, so that patients in each treatment group would receive about equivalent amounts of "total antidepressant drugs," to avoid confusing simple summation of side-effects with unusual toxic drug interactions.

Seventy-one inpatients and outpatients meeting Diagnostic and Statistical Manual-III (DSM-III) criteria for Major Depression were randomly assigned to a 4-week trial of double-blind treatment with either TCP, AMI, or the TCP-AMI combination. After a fixed starting dosage for the first week (either TCP 20 mg, q a.m., AMI 100 mg, q h.s., or TCP 10 mg, q a.m. plus AMI 50 mg, q h.s.), the treating psychiatrist could adjust dosage upwards on a weekly basis to maxima reached by the beginning of the third week (TCP 20 mg, t.i.d., AMI 300 mg, q h.s. or TCP 10 mg, t.i.d. plus AMI 150 mg, q h.s.).

Ratings of depressive symptoms by the patient and the treating psychiatrist were conducted weekly and included the Hamilton Depression and Anxiety Scales, the Clinial Global Impression, and the Zung Self-Rated Depression Scale. Monitoring for toxicity included a side-effect list completed weekly by the treating psychiatrist; frequent measurement of blood pressure, pulse rate, respiratory rate, temperature and weight; and repeated electrocardiograms, complete blood counts, serum electrolytes, liver function tests, and urinalyses.

Sixty patients completed the study; eleven dropped out prior to the end of the fourth week. Patients sometimes dropped out because of side-effects such as drowsiness or dizziness, but never because of life-threatening adverse reactions such as hyperthermic or hypertensive crises. The dropout rate was highest in the AMI-only group (24 percent) and lowest in the combined TCP-AMI group (5 percent).

There were no statistically significant differences between the three treatment groups at baseline on common demographic characteristics such as age, sex, or education; nor on clinical characteristics such as percentage of patients meeting RDC criteria for endogenicity or degree of symptom severity. Average maximum dosage was 40 mg/day TCP, 239 mg/day AMI, and in the combined treatment group 24 mg/day TCP and 128 mg/day AMI.

The psychiatrists, listing of side effects showed similar side-effect profiles for the three treatments. The most common side effects included dry mouth (72 percent of patients reported this), dizziness (61 percent), sedation (41 percent), and constipation (23 percent). Significant differences between the three treatments were confined to a more frequent association of AMI with dry mouth (90 percent) and tremor (40 percent), and a less frequent association of TCP with anticholinergic effects as a group ($p < .01$). Blood pressure measurements suggested both resting and postural hypotension as effects of TCP, but only postural hypotension with AMI. The combined TCP-AMI treatment showed intermediate effects. Pulse rate and weight increases both seemed more pronounced with AMI.

---

[1] Department of Psychiatry and the Behavioral Sciences, University of Southern California School of Medicine, Los Angeles, CA 90033.

On the four major outcome measures, patients on all three treatments improved to an equivalent degree at about the same rate. Improvement was moderate to marked for 76 percent on TCP, 75 percent on AMI, and 79 percent on TCP-AMI. Analyses of individual symptom items suggested superiority of TCP and TCP-AMI over AMI alone for hypochondriasis ($p < .01$ and $p < .03$, respectively), and superiority for AMI and TCP-AMI over TCP alone for insomnia ($p < .01$ and $p < .01$), as well as advantage for TCP over TCP-AMI on anxious mood ($p < .04$) and TCP over AMI on autonomic anxiety ($p < .05$).

These results indicate quite similar therapeutic and adverse effects for all three treatments. There is certainly no indication of either unusually severe toxicity or unusually potent efficacy for the MAOI-TCA combination as compared to the single drugs used alone. However, some differences in specific side effects and symptom improvement may have clinical relevance. For example, TCP may have an advantage in avoidance of anticholinergic side effects, while AMI or TCP-AMI may have an advantage for insomnia. As in prior research, there are suggestions of an MAOI advantage for "atypical" depressive symptoms such as hypochondriasis and anxiety.

These results support the relative safety of combined MAOI-TCA treatment when used according to specific guidelines such as were followed in this study. It should be emphasized that evidence for apparent safety does *not* extend to certain other ways of combining these drugs. For example, there is substantial case report evidence for hazards in the addition of a TCA to an established course of treatment with an MAOI.

Despite these indications of safety if the MAOI-TCA combination is used according to specific guidelines, there exists virtually no evidence from the few controlled studies to date for any major advantage to such combinations over rigorous treatment with single drugs or ECT. Nevertheless, there are suggestions from clinical experience that some patients refractory to adequate trials of the single drugs may still respond to their combination. This issue has yet to be addressed in controlled research.

For a complete review of the literature, see White and Simpson (1981).

Differential Efficacy of L-Deprenyl, a Selective MAO Type-B Inhibitor, in Endogenous and Nonendogenous Depression

**J. John Mann, M.D.,[1] Allen Frances, M.D.[1]
Eric D. Peselow, M.D.,[2] and Samuel Gershon, M.D.[3]**

Introduction

Recent systematic studies have affirmed the value of classical nonselective monoamine oxidase (MAO) inhibitors as effective antidepressants. Overall these drugs appear effective in nonendogenous depression (Robinson et al. 1973) and perhaps some subgroup(s) of endogenous depression (Himmelhoch et al. 1972; Pare & Mack 1971). MAO inhibitors appear as effective as tricyclics for nonendogenous depression and perhaps superior for any associated anxiety symptoms (Ravaris et al. 1980). There is also evidence for a therapeutic effect in phobic disorders (Tyrer 1980). However, despite the usefulness of these agents, the risks of a hypertensive food or drug interraction, known colloquially as the "cheese" reaction, has remained as a deterrent to the use of MAO inhibitors.

The selective MAO type-A inhibitor clorgyline, although appearing to have antidepressant properties in unipolar patients (Wheatley 1970), also has a significant potential for the hypertensive "cheese" reaction comparable to classical MAO inhibitors (Lader et al. 1972). Therefore it is important to evaluate the MAO type-B inhibitors for safety and antidepressant potential. L-deprenyl is a potent selective MAO type-B inhibitor with a demonstrated safety advantage (Elsworth et al. 1978).

In this study, the effects of L-deprenyl were compared in endogenous and nonendogenous depression. We also monitored the degree of platelet MAO inhibition in order to evaluate whether the level of MAO inhibition would be a factor in determining clinical response in this study.

Methods

Twenty-five patients who met Research Diagnostic Criteria for a major depressive disorder completed the study. The patients were subdivided into endogenous and nonendogenous subgroups using the Newcastle scale.

All patients underwent a single-blind placebo washout for one week to screen out strong placebo responders. Patients who still scored 16 or higher on the first 17 items of the Hamilton Depression Scale (HDS) then underwent 4 weeks of treatment with L-deprenyl. Patients were treated with initial doses of 5-10 mg per day for the first week, building up to a maximum of 15-20 mg per day through weekly dose increments depending on clinical response.

Results

Thirteen patients with endogenous depression and 12 with nonendogenous depression were studied. The groups did not differ significantly on age, sex ratio, and baseline severity of illness as measured by the HDS.

As shown in the Figure, both groups showed a statistically significant amerlioration of depression, but the onset of improvement appeared sooner in the nonendogenous group. The rate of dropout was greater in the endogenous group with three patients dropping out because of lack of therapeutic response and one because of hypomania.

If responders were defined by a >50 percent reduction in Hamilton Score or an endpoint score of ≤ 10 in the HDS, then the endogenous group had 6/13 responders and the nonendogenous group had 10/12 responders. The difference in the rate of responders between the two groups approached significance ($p<0.10$ Fisher Exact Probability Test). Five of seven patients responded in the bipolar endogenous group compared to 1/6 unipolar patients, a non significant difference.

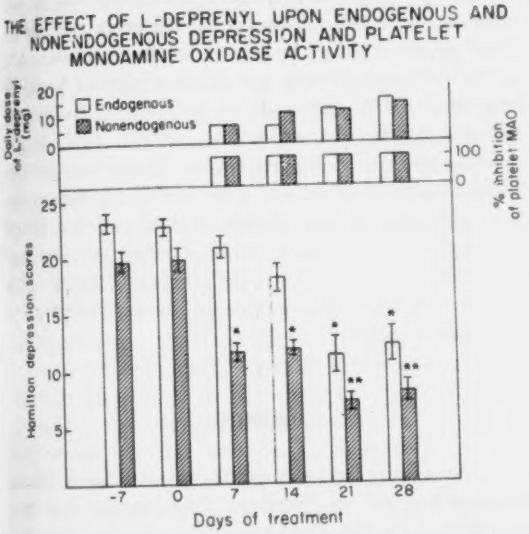
All responders in the endogenous group and 9/10 of the nonendogenous responders had responded according to the above criteria by Day 21. There was a trend for the amelioration in the HDS score after only 1 week of active drug to be greater in the responder groups: (−4 ± 2.5 in the endogenous and −9.1 ± 2.3 in the nonendogenous) than in the nonresponders (−0.1 ± 1.4 and −3.5 ± 1.5), respectively, in endogenous and nonendogenous groups ($p<0.1$ and $p<0.05$, one-tailed t-test).



*p<.05 **p<.01 2-tail t test contrast with day 0 HD scores

FIGURE
(From: Mann et al. *J. Clin. Psychopharmacology,* 2: 54-57, 1982.)

The degree of endogenicity or nonendogenicity as indicated by the Newcastle scale, or the duration of the illness, showed no significant linear correlation with the amelioration in the HDS score in either the endogenous or nonendogenous groups.

The Figure shows the degree of platelet MAO inhibition and the mean daily dosages of L-deprenyl in both groups. Deprenyl was a potent rapid inhibitor of platelet MAO. A 10 mg dose of L-deprenyl almost totally inhibited platelet MAO within 2 hours.

Baseline MAO activity showed no significant linear correlation with amelioration in HDS scores. However, baseline MAO activity of responders in the endogenous and nonendogenous groups was respectively 32.0 ± 6.6 and 24.5 ± 5.4 nmol/hour/mg protein, which, although not statistically higher than nonresponders (22 ± 2.9 and 17.3 ± 7.9), may prove to be significant in a study with greater numbers of patients.

Deprenyl produced several of the typical side effects of classical MAO inhibitors including increased energy, initial insomnia, reduced appetite, increased aggressive feelings, and agitation. However, no changes were seen in blood pressure or electrocardiograph (ECG). In particular, no patient developed significant orthostatic hypotension (a drop in systolic blood pressure of >20 mmHg). When each group was subdivided into responders and nonresponders, there were still no significant changes in blood pressure. In contrast to classical nonselective MAOIs, no patients developed impotence or peripheral edema.

Discussion

There is a body of evidence in the literature suggesting that classical MAO inhibitors such as phenelzine are more effective in nonendogenous rather than endogenous depression as a whole. Although this study had design limitations by being an open study, and involved relatively small numbers of patients, L-deprenyl did appear to have an antidepressant effect in nonendogenous depression and perhaps the bipolar subgroup of endogenous depression (in contrast to unipolar endogenous depressives) in a dose range that is reported to preserve selective MAO inhibition (Ekstedt et al. 1979; Reiderer & Reynolds 1980).

The use of selective MAO inhibitors, apart from creating the possibility of safer, more specific drugs, also permits a valuable alternative approach to the biochemical subclassification of depressive disorders. We are initiating double-blind controlled studies to examine the therapeutic spectrum of action of L-deprenyl and its efficacy in order to evaluate the potential biochemical heterogeneity of depressive disorders. Mendlewicz (1982) has recently reported that L-deprenyl was an effective antidepressant in a group of patients with major depression in a placebo-controlled, double-blind study.

Pharmacological Treatment of Delusional Depressives[1]

Duane G. Spiker, M.D.,[2] Israel Hanin, Ph.D.,[2] James M. Perel, Ph.D.,[2] Jane E. Cofsky, M.S.W.,[2] Albert J. Rossi, M.D.,[2] and Denise Sorisio, B.S.[2]

Introduction

The optimal pharmacological treatment of patients with a delusional depression is not clear. Most of the studies reported in the literature are either retrospective or not double-blind (Avery & Winokur 1977; Moradi et al. 1979; Nelson & Bowers 1978). In addition, only a few of the studies measured plasma levels of the tricyclic antidepressant (Glassman et al. 1977). Consequently, a prospective double-blind study of delusional depressives, in which plasma levels of the antidepressant were measured, was initiated. This report describes the results of the first 2 years of the 3-year project.

Method

All subjects were inpatients on the Clinical Research Unit at Western Psychiatric Institute and Clinic (WPIC). At the time of admission, patients were given a traditional psychiatric interview and a complete physical examination. During the subsequent 7-day drug-free period, they underwent a variety of routine laboratory tests including thyroid function tests, an electroencephalogram, and any other tests indicated based on their history and physical examination. Any patient who was found to have a medical illness affecting his or her central nervous system was excluded from the study. All patients gave informed consent.

At the end of the 7-day drug-free period, the Schedule for Affective Disorders and Schizophrenia (SADS) (Endicott & Spitzer 1978) was completed using information from the initial interview, case records, collateral information from relatives, observation on the unit, and a second interview with each patient. The SADS is a structured research interview that collects information necessary to make diagnoses using the Research Diagnostic Criteria (RDC) (Spitzer et al. 1978). For inclusion in the study the patients had to meet the RDC for major depressive disorder, primary subtype. In addition, they had to meet the criteria for psychotic subtype based on the presence of a clear-cut delusion. The severity of depression was measured by the Hamilton Rating Scale (HRS), using the sum of two raters on the 17-item HRS (Hamilton 1960). Patients entered the study if the combined HRS score for two raters was 30 or more. After the 7-day drug-free period, the patients were randomly assigned to perphenazine, amitriptyline, or perphenazine + amitriptyline in adequate doses for 35 days. Blood collection and measurement of plasma levels of amitriptyline and nortriptyline were measured as previously described (Kupfer et al. 1977).

---

[1] This study was supported in part by USPHS Grant MH-32707 from the National Institute of Mental Health.

[2] Department of Psychiatry, University of Pittsburgh School of Medicine, Western Psychiatric Institute and Clinic, Pittsburgh, PA 15213.

To date, 44 patients have entered the study and 36 have completed the 35-day project. Four patients left the hospital against medical advice for reasons unrelated to the protocol. Two patients developed an organic brain syndrome — one on perphenazine and one on amitriptyline + perphenazine. One patient became unmanageable on amitripyline. One patient was dropped because of medical problems unrelated to the study. The responses of the 36 patients who completed the study are shown in Table 1. Responders were defined as patients who no longer were delusional or depressed. Nonresponders were defined as patients who were either depressed, delusional, or both. The patients so far have been either clear-cut responders or clear-cut nonresponders.

Table 1

Response to Treatment

	Responders	Nonresponders
Amitriptyline	3	6
Perphenazine	2	11
Amitriptyline + Perphenazine	11	3

The role of amitriptyline and its metabolite nortriptyline in explaining why some delusionally depressed patients respond to amitriptyline and some do not is unclear. Of the nine patients on amitriptyline who completed the study, three were responders and six were nonresponders. Their plasma levels of amitriptyline and nortriptyline are shown in Table 2. The plasma level of 200 ng/ml of amitriptyline + nortriptyline was used because previous work at WPIC using the same methodology has shown that amitriptyline + nortriptyline ≥ 200 ng/ml is the effective level for treating nondelusional depressed patients (Kupfer et al. 1977).

Patients who were treated with amitriptyline + perphenazine had a mean plasma level of amitriptyline + nortriptyline of 297 ng/ml, while patients treated only with amitriptyline had a mean plasma level of 245 ng/ml.

Discussion

Although the sample size is still too small to make a definitive statement, some trends are apparent. The combination of the antidepressant and the antipsychotic appears to be the most efficacious with a 79 percent response rate. There are very clearly patients with a delusional depression who do respond to an antidepressant alone. There is also a suggestion that the response rate increases with increasing plasma levels of amitriptyline + nortriptyline. Interestingly, amitriptyline alone appears to be more effective than perphenazine alone. Whether the increased response rate of patients treated with amitriptyline + perphenazine can be explained by the increased amitriptyline + nortriptyline plasma levels, or whether the perphenazine has some additional effect, remains to be determined.

Table 2

Plasma Levels of Amitriptyline + Nortriptyline in Patients Treated with Amitriptyline

	Responders	Nonresponders
Amitriptyline + Nortriptyline ≤ 200 ng/ml	1	3
Amitriptyline + Nortriptyline ≥ 200 ng/ml	2	3

Erythrocyte and Plasma Choline In Bipolar Psychiatric Patients: A Followup Study[1]

Israel Hanin, Ph.D.,[2] Bruce M. Cohen, M.D., Ph.D.,[3] Ursula Kopp,[2] and Joseph F. Lipinski, M.D.[3]

Introduction

Over the past four years there has been considerable interest in red blood cell (RBC) choline (Ch) as a potential cholinergic marker. Significantly elevated levels of RBC Ch have been reported in a subset of drug-free unipolar depressed patients (Hanin et al. 1980a); in drug-free bipolar manic patients (Jope et al. 1980); in patients with Gilles de la Tourette's Syndrome (Hanin et al. 1979); in a major portion of biological relatives of patients with Gilles de la Tourette's Syndrome (Comings et al. 1982); as well as in a segment of patients with Alzheimer's disease (Barclay et al. 1982, Friedman et al. 1981).

These elevated levels of RBC Ch are not drug induced; in fact, among the commonly used psychotherapeutic agents to date, only lithium has been shown to alter RBC Ch levels (Domino et al. 1981; Hanin et al. 1981; Jones & Kuchel 1980; Jope et al. 1978; Shea et al. 1981). This effect appears to be irreversible (Lee et al. 1974), and due to inhibition of efflux of Ch accumulated as a result of breakdown of membrane phospholipids on the inside of the RBC (Hanin et al. 1980b; Jenden et al. 1980).

The clinical significance of these elevated RBC Ch levels, whether endogenous or related to chronic lithium administration, is as yet not entirely understood. However, there still is a need for more well-controlled analyses to be conducted, and for reliable baseline data to be obtained (without any room for individual bias in interpreting the results), before one can move on to the

[3] McLean Hospital Mailman Research Center, Clinical Biochemistry Laboratory, Belmont, MA 02178.

task of establishing any clinical relevance, or any potential biological marker role for RBC Ch *in vivo*. Hence the present studies, the results of which are reported in this paper.

Method

These results represent a collaborative effort between investigators from two institutions: Western Psychiatric Institute and Clinic Department of Psychiatry (WPIC), University of Pittsburgh School of Medicine (I.H. and U.K.); and the McLean Hospital Mailman Research Center, Laboratories for Psychiatric Research, in Belmont, Massachusetts (B.M.C. and J.F.L.). These studies were conducted for the purpose of establishing plasma and RBC Ch levels in a broad spectrum of manic-depressive patients, using a totally "blind" approach for data handling.

Patients were diagnosed and selected at McLean Hospital; blood samples were coded, processed, frozen, sent in dry ice packing to Pittsburgh, and stored at −20°C until preparation for analysis. Thawing, isolation, and analysis of Ch content in all samples was conducted in Pittsburgh. The results were then sent to McLean Hospital and decoded.

Patients selected for these studies were between 18 and 55 years old. They were admitted to the study on the condition that they had received no prior psychoactive medication for at least 1 month; no depot neuroleptic for at least 3 months; and no lithium for at least 6 months (except where specifically noted below). Patients were diagnosed by Diagnostic and Statistical Manual-III (DSM-III) criteria. They were excluded from the study if the presence of medical or neurological disease was noted.

On admission, patients were subjected to routine blood work (CBC, SMA-12, T4), urine analysis, ECG, EEG, chest X-ray, and a physical examination. This was followed by weekly determinations of complete blood count and SMA-12. Vital signs were taken daily. Subjects remained off all medications in the hospital for several days, during which blood was drawn for baseline Ch levels.

Blood (10 ml) was drawn in the morning after an overnight fast, into heparinized (green top) Venoject® tubes, and processed according to Hanin et al. (1980a). Subsequent analysis of plasma and RBC Ch was conducted using gas chromatography-mass spectrometry, according to Hanin and Skinner (1975).

In manic patients serial bloods were also drawn weekly for Ch determinations during treatment. Treatment with lithium alone, lecithin alone, or a combination of both are as noted in data shown below. Lithium carbonate was started at 300 mg b.i.d. Serum lithium levels were subsequently adjusted to 0.5-0.7 meq/l in the second week. Lecithin (Phospholipon 100, 30 g/day dissolved in ethanol) on ice cream was given to patients in three divided doses. Placebo for lecithin consisted of cod liver oil, castor oil, and ethanol.

Control subjects were drug-free, psychiatrically normal individuals, of the same age range as the patients.

Results

RBC and Plasma Ch levels: Drug-Free Manics vs. Controls

Table 1 shows values of plasma and RBC Ch levels measured in 18 drug-free bipolar disorder manic patients. Table 2 shows values of plasma and RBC Ch levels measured in 18 normal control subjects. While mean RBC Ch levels appeared to be higher in the manic patients, the values were not significantly different from RBC values in the control group ($t=1.04$; $N=34$). Also, the range of values was quite similar for both groups. Neither were plasma Ch levels significantly different between the two groups ($t=0.39$; $N=34$).

Effect of Lithium Treatment on RBC and Plasma Ch Levels

Results obtained with eight manic patients are shown in Table 3. Time of exposure of these patients to lithium varied between individuals. It is nevertheless clear that lithium treatment significantly elevated RBC Ch levels, while not affecting plasma Ch levels at all (Compare Tables 1 and 2).

Effect of Lecithin Alone, or Concurrent with Lithium and Other Drugs on Plasma and RBC Ch Levels

Table 4 demonstrates the effect of lecithin treatment on plasma and RBC Ch levels. Subjects were concurrently drug-free, or treated with another psychotropic agent, as specified in the Table.

Although variable, and shown only in the case of four individuals, the measured changes in plasma and Ch levels are important for purposes of interpreting the role of the RBC as a Ch carrier *in vivo*. (*See* Discussion)

Discussion and Summary

The data reported in this paper confirm some of our earlier findings; disagree with others reported in the literature; and also provide some new intriguing observations which will require further experimentation and analysis. Although preliminary, the authors believe that these findings were well worth reporting, particularly because of the "double-blind" circumstances inherent in the generation and analysis of the data.

The results reported in this paper allow for the following conclusions:

1. *In drug-free manics RBC Ch and plasma Ch levels are not statistically different from the respective values found in controls.* The authors' data thus are in contradiction to Jope et al. (1980), who reported

elevated levels of RBC Ch in patients diagnosed as manic, prior to lithium therapy. Shea et al. (1981) have also reported that there was no significant difference in RBC Ch between lithium-free patients with affective disorder and normal subjects. Unfortunately the number of drug-free bipolar manics in this group of patients was not identified.

At present there is no clear explanation for the discrepancy in these reported results. The differences could not be attributed to methodologic variances since both Hanin and co-investigators, and Jope and co-investigators used an essentially identical gas chromatograph-mass spectrometric technique for the analysis of RBC Ch levels, while Shea and co-investigators used a radioenzymatic assay. Conceivably, the differences could be due to the fact that, once lithium treatment is discontinued, drug-induced elevated RBC Ch levels require over 4 months (essentially the life-time of the RBC) to return to normal (Hanin et al. 1980b). Thus, any prior exposure to lithium within 4 to 5 months of the analysis in any of the five patients used by Jope and co-investigators could explain the elevation in RBC Ch levels as reported by these investigators. In the present studies extra precautions were taken to exclude from the protocol any patient who had been exposed to lithium within 6 months of the time of the analysis for RBC and plasma Ch levels. Further studies with a large number of patients may resolve this question.

2. *Lithium treatment significantly elevates RBC Ch levels.* This finding confirms earlier reports from the laboratories of Jope, Jones, Hanin, Domino, Shea, and others.

3. *Plasma Ch is not significantly affected by lithium treatment.* Shea et al. (1981) did however report significantly elevated levels of plasma Ch in samples obtained from lithium-treated patients. These investigators state that it is possible that the plasma was contaminated by RBC, although any plasma samples with a tinge of red were discarded. In any case, the elevation in plasma Ch levels observed by Shea and co-investigators was only twofold at best, while RBC Ch levels were elevated more than tenfold.

4. *Treatment of patients with lecithin elevates plasma Ch levels, irrespective of whether RBC Ch levels are concomitantly in the "normal" range, or abnormally elevated due to lithium therapy.*

This finding, in conjunction with data summarized above, suggests separate physiological roles for Ch in plasma and in RBCs. The findings suggest that both compartments in blood should be considered as separate, yet interdependent, entities in their function as carriers of Ch from blood to other tissues, *in vivo*.

Table 4

Plasma (P) and Erythrocyte (RBC) Choline (nmol/ml) in Patients Before and After Receiving Lecithin

Subject	Age	Sex	Lecithin	Other Medications	Plasma Choline	RBC Choline
A	18	M	None	Haldol, Artane	9.6	10.2
			On × 4 days	Haldol, Artane	13.5	16.3
			Off × 5 days	Haldol, Artane	5.9	7.1
			Off × 10 days	Haldol, Artane	9.3	7.2
			Off × 17 days	Lithium × 6 days	9.3	126.2
B	26	M	None	Tril, Artane, Lithium	6.9	376.0
			On × 10 days	Tril, Artane, Lithium	29.1	682.2
			Off × 8 days	Tril, Artane, Lithium	10.1	462.7
C	33	F	None	None, but on lithium	6.5	127.5
			On × 1 days	within a few months	23.8	127.8
			On × 10 days	of admission	25.1	203.6
D	22	F	None	Mellaril, Lithium	5.7	334.4
			On × 7 days	Mellaril, Lithium	19.3	259.4

It is anticipated that future studies will ascertain whether the extent of normal exchange of Ch between plasma and RBC in blood will, in turn, predicate the amount of free Ch available to key physiological sites *in vivo*; such as the cholinergic nerve terminal for the synthesis of acetylcholine. Previous studies by Hanin et al. (1980b) have clearly demonstrated that Ch exchange between plasma and RBC is inversely proportional to RBC Ch levels. In clinical situations where endogenous RBC Ch levels have been shown to be higher than normal, this could reflect deviations from normal in the extent of availability of Ch to central nerve terminals crucial for acetylcholine synthesis *in vivo*.

Relationship Between Cognition and Mood in Geriatric Depression

Barry Reisberg, M.D.,[1] Steven H. Ferris, Ph.D.,[1] Anastase Georgotas, M.D.,[1] Mony J. de Leon, Ed.D.,[1] and Michael K. Schneck, M.D.[1]

The interrelationship between cognition and affect among geriatric depressed patients is an area of major clinical and therapeutic importance. The clinical importance of this relationship derives from the need to differentiate geriatric depression and Primary Degenerative Dementia (PDD), the two major psychiatric disorders of the elderly. Current evidence indicates that depressed patients do not demonstrate marked global cognitive deficits (Friedman 1964; Neville & Folstein 1979; Sternberg & Jarvik 1976). However, depressed patients do rate themselves more negatively in cognitive and other areas (Friedman 1964), and may demonstrate deficits in circumscribed cognitive areas, notably on attention and immediate memory tasks (Neville & Folstein 1979; Sternberg & Jarvik 1976). Because of the potential importance and implications of the relationship between geriatric depression and cognition, we examined the correlation between magnitude of both self-rated and clinically rated depression and the magnitude of cognitive deficit in elderly outpatients.

Method

Twenty-two outpatient volunteers (mean age 64.8 ± 4.5 years) with subjective complaints of depression were accepted for the study. They met all of the following criteria after treatment with placebo for 7 days: 1) 60 to 85 years of age; 2) a score of 18 or more on the 17-item Hamilton Rating Scale (Hamilton 1960); 3) a Wechsler Adult Intelligence Scale Vocabulary Score ≥ 8 (Wechsler 1941); 4) at least five symptoms of Depressive Affective Disorder, Diagnostic and Statistical Manual-III (DSM-III) diagnoses 296.2, 296.3, 296.5, 296.6, or 300 (American Psychiatric Association 1980), including depressed mood; 5) clinical laboratory evaluations within ± 10 percent of the normal range. Patients were excluded if they had a history of, or active symptoms indicating: 1) central nervous system (CNS) infection, neoplasm, or evidence of progressive neurologic disease other than PDD; 2) epilepsy; 3) schizophrenia; 4) alcoholism or drug dependence; 5) other psychiatric conditions which prevented the subject's cooperation in the study; or 6) major medical illnesses including uncontrolled congestive heart failure, uncontrolled diabetes mellitis, chronic pulmonary insufficiency, or severe angina.

The patients were assessed with respect to clinical and psychometric parameters. The degree of memory impairment was assessed using the Guild Memory Scale (Gilbert et al. 1968; Gilbert & Levee 1971). Normative values are available for each of the five subtests of the Guild with respect to age and intelligence level as estimated by the Wechsler Adult Intelligence Scale (WAIS) vocabulary score of the subject (Crook et al. 1980). Additional cognitive measures included assessment of primary (short-term) memory, digit span forward and backward; secondary (long-term) memory; First and Last Names (French et al. 1974); Memory for Faces (Ferris et al. 1980); and perceptual-motor tasks: Perceptual Speed (Moran & Mefferd 1959), Simple and Disjunctive Reaction Time (Ferris et al. 1976), and Finger-Tapping Speed (Lehmann & Ban 1970).

The clinical assessments included two psychiatric ratings, the Hamilton Depression Scale, and the Inventory of Psychic and Somatic Complaints in the Elderly (IPSC-E) (Raskin & Crook 1977); and two self-ratings, the Beck Depression Inventory (Beck et al. 1961), and the Mood Scale for the Elderly (MS-E) (Raskin & Crook 1976). Pearson correlation coefficients were computed between the psychiatrist-rated or self-rated clinical assessments and the psychometric test performance scores.

Results

Based upon the norms for the Guild Memory Test, nine subjects were above average in memory, seven were below average, and six were one standard deviation or more below average.

---

[1] Geriatric Study and Treatment Program, Department of Psychiatry, New York University Medical Center, New York, NY 10016.

No subjects demonstrated more than mild global cognitive deterioration as defined on the Global Deterioration Scale (GDS) for PDD (GDS ≤ 3), an instrument for which Guild and clinical rating criteria are available (Reisberg et al. 1982). Hence, depressive affective disorder was not associated with marked cognitive impairment in these elderly outpatients.

There were no statistically significant correlations between total Hamilton scores and any of the psychometric test scores. For the IPSC-E, the total score on the depression cluster, (Items 8 through 14) correlated only with simple reaction time ($r = .51$, $p < .05$). When total IPSC-E Depression scores were combined with related assessments of Energy Loss (Items 1 through 7), Sleep Disturbance (Items 15 through 17), and Anxiety-Tension (Items 18 through 25), no significant correlations with performance on any of the psychometric tests were observed. Total self-assessment scores on the Beck Depression Scale also failed to correlate significantly with any of the psychometric test scores. Self-assessments of negative mood on the MS-E correlated with poor performance on four of the psychometric measures (*see* Table). The strongest relationship ($r = .68$, $p < .01$), was observed for slowing of simple reaction time.

Conclusions

Our findings with respect to the magnitude of cognitive impairment in geriatric depressed outpatients are consistent with the findings of previous investigators with respect to both adult depression (Friedman 1964; Sternberg & Jarvik 1976) and geriatric depression (Neville & Folstein 1979). Specifically, geriatric patients with clinically significant depression actually perform better than average (41 percent of our sample), or only slightly below average (32 percent), on assessments of memory. Hence, the overall magnitude of cognitive impairment associated with geriatric depression in most patients is not large.

However, sensitive clinical mood assessment instruments and cognitive tests are capable of demonstrating some significant relationships between magnitude of depression and psychometric performance. These relationships occurred only for measures such as reaction time, perceptual speed and motor speed, but not for measures of memory function. Since these tests are measures of attention or alertness, our results are consistent with earlier findings suggesting attentional, rather than memory deficits in geriatric depressed patients (Neville & Folstein 1979). Self-ratings of dysphoric mood on the MS-E were found to relate more strongly to impaired psychometric performance than psychiatrist's assessments of the magnitude of dysphoric symptomatology.

We have previously found that in patients with early symptoms of age associated cognitive decline or PDD, psychometric deficits of a global nature tend to accompany progression of the disorder (Reisberg et al. 1981). Hence, the patterns of psychometric impairments in geriatric depression and in PDD do appear to differ. Further work is needed to determine if these patterns are of differential diagnostic significance.

Table

Cerebrospinal Fluid Acetylcholine, Choline, and Senile Dementia of the Alzheimer's Type[1]

Kenneth L. Davis, M.D.,[2] John Y-K. Hsieh, Ph.D.,[2] Michael I. Levy, M.D.,[2] Thomas B. Horvath, M.D.,[2] Bonnie M. Davis, M.D.,[2] and Richard C. Mohs, Ph.D.[2]

Degeneration of cholinergic neurons and formation of neurofibrillary tangles and senile plaques are characteristic findings in postmortem studies of patients with senile dementia of the Alzheimer's type (SDAT). The extent of these changes corresponds with the degree of memory loss as measured by psychometric tests such as the Memory Information Test (MIT) (Blessed et al. 1968). Brain samples from patients with SDAT display a significant loss of choline acetyltransferase (CAT) activity (Davies 1979), indicating that SDAT can be characterized by a deficit in central cholinergic activity. However, diminished dopaminergic, noradrenergic, and serotoninergic activity have all been implicated in SDAT, (Bowen et al. 1979; Carlsson et al. 1980) though not with the consistency of the cholinergic abnormality. Improved memory test performance following the administration of cholinergic drugs to patients with SDAT suggests that the cholinergic deficit is involved in the cognitive abnormalities of this disease (Davis et al. 1981). The present study was undertaken to determine whether cerebrospinal fluid (CSF) acetylcholine (Ach) concentrations and/or the concentrations of the major CSF metabolites of dopamine, norepinephrine, and serotonin are related to the severity of dementia in patients with SDAT.

Methods

Ten males and four females, ages 53-80, who met Research Diagnostic Criteria for primary dementia/SDAT were entered in the study (Spitzer et al. 1978). Prior to entry particular attention was given to ruling out multi-infarct dementia, depression, alcoholism, and other medical causes of dementia. The MIT was administered by a trained rater prior to the lumbar puncture. The lumbar puncture was performed at 9:00 a.m. with the patient in recumbent position after 10 hours of bedrest. No medications had been given except an occasional dose of chloral hydrate to some patients for 2 weeks prior to the lumbar puncture.

CSF was collected into a dry ice bath and immediately frozen at − 70°C for storage. The first through fifth milliliters of CSF were analyzed by gas chromatograph/mass spectrometry (GCMS) for acetlycholine and choline (Jenden et al. 1973). All reagents were distilled twice before conducting the assay. This assay has a minimum sensitivity of approximately .025 nanomoles/ml. The interassay variability is 16 percent for Ach, and 7 percent for choline. The intraassay variability is 16 percent for Ach, and 9 percent for choline. Values derived from this procedure are in agreement with previous published data (Welch et al. 1976). The sixth through twelfth milliliters were analyzed for homovanillic acid (HVA), 5-hydroxyindoleacetic acid (5-HIAA) and 3-methoxy-5-hydroxyphenylethyleneglycol (MHPG) (Anderson et al. 1979; Karoum et al. 1975).

Results

The Pearson correlation coefficient of MIT scores with CSF acetylcholine levels was $r=0.76$ ($p<.005$). Thus, patients with the most impaired memory functioning tended to have low acetylcholine concentrations in the CSF (*see* Table). There was a nonsignificant trend for CSF choline to increase as the severity of the dementia increased. The ratio of choline/Ach was inversely correlated with the severity of the dementia to a significant degree ($r=-0.79$, $p<.001$). There was no significant correlation of CSF levels of HVA, 5-HIAA, or MHPG with the severity of dementia

[a] MIT = Memory Information Test

Discussion

The results provide further evidence of the importance of the cholinergic deficiency in SDAT. Postmortem studies of patients with SDAT have emphasized the highly selective degeneration of cholinergic neurons, citing normal levels of synthetic enzymes associated with other neurotransmitter systems (Davies & Maloney 1976; Perry et al. 1977). The absence of a correlation of dementia with HVA, 5-HIAA, and MHPG levels here corroborates those studies.

The correlation of CSF Ach concentrations with severity of dementia as assessed by a histopathologically validated instrument represents the first biological antemortem reflection (excluding surgical brain biopsy) of the extent of illness in patients with SDAT. The crucial role of cholinergic activity in the memory deficit of SDAT is supported by this finding. Future applications might include predicting response to potential cholinomimetic drug treatments based on CSF Ach level, and monitoring the progression of the illness longitudinally. Measurement of CSF Ach in other types of dementia may yield data useful clinically in differential diagnosis.

Summary

Concentrations of several neurotransmitters and metabolites were measured in the CSF of patients with SDAT. CSF Ach concentration correlated significantly with memory test scores in these patients. There was no correlation with several other neurotransmitter metabolites.

Cognitive and Performance Deficits in Depression

Allen Raskin, Ph.D.,[1] Alfred S. Friedman, Ph.D.,[2] and Alberto DiMascio, Ph.D.[3]

Among the characteristics most often cited as behavioral correlates of depressive illnesses are (a) disturbed psychomotor activity involving retardation or agitation, (b) ideational disturbances such as limitations of span of attention, slowness of thought processes, and learning impairment, (c) self-depreciation which is reflected by a lowering of level of aspiration and feelings of inadequacy, and (d) energy diminution with loss of drive and motivation (Ayd 1961; Lehmann 1965).

Empirical studies have not been uniformly successful in documenting these behavioral correlates of depression. For example, with regard to psychomotor functioning such as simple reaction time, investigators have found both no difference among normals and depressed patients (Hall & Stride 1954), and depressed patients to be slower than normals (Huston & Senf 1952). A similar situation obtains with regard to learning and other cognitive functions. For example, one study reported short-term memory deficits in depression (Sternberg & Jarvik 1976) whereas another failed to find impairment in short-term memory (Henry et al. 1973).

These inconsistencies across studies have been attributed to differences in the types and severity of illness of depressed patients admitted to these studies as well as the differences in how certain functions, such as short-term memory, are defined and assessed.

The general aim of the present study was to determine what effects, if any, the presence of moderate to severe depression has on tests sampling the aforementioned behavioral correlates of depression. The differential effects of age and sex on these measures was also examined.

Method

Patients

The study sample consisted of 277 patients drawn from three State hospitals (Boston State Hospital, Boston, Mass., Rochester State Hospital, Rochester, New York, and Rochester State Hospital, Rochester, Minn.) and two private institutions (Hartford Hospital, Hartford, Conn., and Philadelphia Psychiatric Center, Philadelphia, Pa.).

For admission, patients had to be newly hospitalized, between 16 and 70 years of age, and with no evidence of mental deficiency, chronic alcoholism, liver damage, unequivocal brain damage, cardiovascular disease, or epilepsy. Project coordinators (a psychiatrist or psychologist) at each hospital also rated patients on amount of depression in verbal report, behavior, and secondary symptoms of depression. Each of these three items were rated on 5-point intensity scales. For admission to the study, a patient had to achieve a total score of at least nine, which would be the equivalent of a moderate amount of depression.

Normals

The 112 normal subjects were drawn from the same institutions as the patients and matched to the patient sample on age, sex, and years of schooling (*see* Table 1). Although not noted in Table 1, there was also no significant difference between normals and patients on the vocabulary subtest of the Wechsler-Bellevue Intelligence Scale II. The normal subjects were between 16 and 60 years of age and the same exclusion criteria previously cited for the patients were applied to normal subjects. In addition, a normal subject could not be receiving in- or outpatient treatment for a medical disability, be a discharged mental patient being followed in an aftercare clinic, or be undergoing psychiatric treatment. These subjects also had to meet Diagnostic and Statistical Manual-II (DSM-II) criteria for No Mental Disorder (DSM-II diagnosis 318).

Identifying and Background Characteristics of Study Sample

	Patients	Normals
Number	277	112
Age (Median)	41	42[a]
Sex (% female)	68	66[a]
Years Schooling (median)	11	12[a]
Neurotic Depression (%)[b]	51	
Psychotic Depression (%)[b]	38	
Schizoaffoctive (%)[b]	11	
Anxious Depression (%)[c]	29	
Withdrawn-Retarded Depression (%)[c]	20	

[a] None of the differences between the two groups on these demographic variables were statistically significant.

[b] Based on diagnoses in the Diagnostic and Statistical Manual-II.

[c] Based on depressive subtypes developed by John E. Overall.

Measures

There were 13 separate tests in the test battery yielding a total of 33 scores. A brief description of each test follows:

Psychomotor Performance. (a) Tapping. The rate of a simple repetitive movement is determined under both a "free" or non-speed condition, and a maximum speed condition. For each condition the number of taps in a 30-second period is recorded. After each trial, the subject is asked to estimate how many taps she or he did. (b) The Area Tapping Test (Foulds 1961). On this test, Caine (1960) found depressives to be constricted and cover less area on the paper than nondepressed individuals. The subject is instructed to make dots with a pencil on a piece of 8½ × 11" paper for a period of 1 minute. An 8½ × 11" clear stencil divided into squares indicates the total number of squares containing dots. (c) Circle Tracing Test. The Circle Tracing Test (Siegman 1961) is considered to be a test of the subject's impulse control level (motor-inhibition capacity). The subject is instructed to "trace this circle. . . as slowly as possible." The score is the time taken to complete the tracing. (d) Aiming. This paper and pencil visual-motor coordination test from Moran and Mefferd's (1959) battery involves the placing of a dot in the center of a series of circles 2mm in diameter. The number of dots placed completely within the circles, in each of four 30-second consecutive testing periods, and the number of errors (dots touching the edges or outside the circle), are recorded. After the task has been completed, the patient is asked to estimate the percentage of the time he was completely within the circle.

Measures of Ideational, Perceptual, and Cognitive Functioning. (a) Nonsense-syllable learning task. This task requires both learning and immediate recall. A list of 10 three-letter consonant nonsense syllables to be learned are presented on a memory drum. The syllables are presented twice, each for 3 seconds, in two different orders. A 1-minute task is then interposed. At its completion, the subjects are instructed to recall and write down correctly as many of the syllables as possible. The number of syllables recalled or attempted are recorded; the number of those that are correct recalls are also recorded. (b) The Gorham Proverb Test (1956). This test is used to assess verbal comprehension and abstract conceptualization. The subject's task is to give the meanings of proverbs. Thirteen items from Gorham's 40-item multiple-choice form of the test were selected for this study. From among four possible interpretations, the patient is to choose the best answer. These answers are ordered on the answer sheet from most abstract to most concrete. Three scores are obtained: an "Abstract" score, a "Concrete" score, and the combined "Adjusted" score. No time limit is imposed. (c) Unpaced Digit-Symbol Substitution Test. This test is a measure of incidental memory and learning. The Wechsler-Bellevue Intelligence Scale-II 2-minute subtest was used. The number of digit symbol substitutions and the number of errors made, in each of four consecutive 30-second periods, was recorded. (d) Paced Digit-Symbol Substitution Test. The paced digit-symbol test is similar to the regular or unpaced test with the exception that the numbers, rather than being presented on the sheet on which the symbols are to be written, are presented by means of a memory drum. The numbers are presented at the rate of 40 per minute, i.e., at 1½-second intervals. Because of the added pressure to respond within a specified time, it was felt that depressed patients would have more difficulty with paced tasks than with unpaced tasks. Three scores are derived from this test, the number of correct symbols, the number of errors, and the number of omissions. (e) Estimating Dots. This is a technique developed by Fisher, Williams, and Lubin (1957) that is considered to be a measure of self-adequacy or, conversely, of uncertainty of judgment. Subjects are shown a series of 10 cards each containing a large number of dots. After each presentation of a card, for 10 seconds, the subject is asked to estimate the number of dots on the card shown and then to reevaluate his estimate and to indicate by how many dots he felt he was in error. (f) Time Estimation. This task taps the ability to experience perceptual phenomena in the absence of external cues. Two procedures are employed. First, the subject is asked to estimate how many seconds have elapsed between two signals (i.e., "start" and "stop"). A 15-second interval between the two signals is employed. Next, the subject is required to give a signal (i.e., "stop") when 15 seconds has elapsed after the signal to "start" has been given. The two times, in seconds, are recorded. (g) Shift Test (Friedman 1964). This task taps flexibility of mental set or maintenance of motivation to a boring routine task, and involves circling a specified digit whenever it occurs (irregularly) on a page of digits, and then shifting on command to circle a different digit and discontinue circling the previous digit. This is a 1 ½-minute task, requiring three shift commands, each of 30-second duration. The number of digits completed in each 30-second period is recorded. (h) The Stroop Color-Word Interference Test (1935). This test is used to assess conceptual set and flexibility. The subjects are presented a card containing 50 color-name words printed in a colored ink that is incongruous with the printed name. The subjects' task is to name the color of the ink in which the color-name words are printed. The score is the time taken to name the 50 colors on the card. The number of wrong responses is also recorded. (i) Clock Reversal Test. This is also a test of perceptual flexibility. The first two trials of this task merely require the subject to read the times on two cards (with hands but without numbers) indicated by the position of the hour and minute hands. In the third trial, the subject is not shown a card but told to imagine where the hour and minute hands would be if 12:30 were reversed. In the final trial, the subject is asked to reverse 3:20. Each of the four parts of this test are scored to indicate whether the subject gave the correct or incorrect response.

Testing was done soon after the patients' admission to the hospital and after patients had been off all psychoactive medication for a minimum of 4 days. In most instances, patients were kept off medication for at least a week prior to testing. The order of testing is indicated in Table 2. At the end of testing, test examiners completed a modified version of the Friedhoff Task Behavior Scale (Friedhoff & Alpert 1960). This test includes items sampling the patient's ability to cooperate and attend to the tasks. Patients who had considerable difficulty in attending or who were very uncooperative were dropped from the study. Total testing time was approximately 1 hour.

Statistical Analysis. A multivariate analysis of variance was used to test for group differences. Main effects in this model were group (patient vs. normal), sex, and age (under 40 vs. 40 and over). The score attained on the Vocabulary subtest of the Wechsler-Bellevue Intelligence Scale-II a continuous variable, was entered as a regression in the model. This model also generated three interaction terms, group by sex, group by age, and group by vocabulary score. Each main effect term was tested with the other main effects co-varied out. Hence, in the tests for differences between patients and normals the effects of age, sex, and vocabulary score were partialled out.

Table 2

Test Battery

Order of Testing
1. Tapping under free and speed conditions
2. Dot estimation (Fisher, Williams, & Lubin)
3. Aiming (Moran & Mefferd)
4. Time estimation
5. Unpaced digit symbol substitution (Wechsler)
6. Clock reversal
7. Shift test (Friedman)
8. Stroop Color-Word Interference Test
9. Area Tapping Test (Foulds)
10. Circle Tracing Test (Siegman)
11. Paced Digit Symbol
12. Learning and recall of nonsense syllables
13. Gorham Proverb Test

Results

Patients vs. Normals

There were significant patient-normal differences on 11 of the 13 tests and on 25 of the 33 scores derived from these tests. These results are presented in Table 3. The two tests that failed to show patient-normal differences were Time Estimation and Dot Estimation. Inter-individual variability for both patients and normals was very high on these tests which inflated the error terms and washed out patient-normal differences.

Table 3

Significant Differences Between Depressed Patients and Normal Controls on Cognitive and Psychomotor Tests

	Mean Scores		
Variable	Patients	Normals	F-ratio
A. Tapping			
1. Free condition	69.65	55.93	10.28[b]
2. Additional taps under speed condition	54.17	75.22	25.07[b]
B. Aiming

[a] Significant at .05 level (2-tailed).
[b] Significant at .01 level (2-tailed).

The number and breadth of the differences between patients and normals was surprising. A prior study by one of the authors (Friedman 1964) had found only modest differences between depressed patients and normals on psychomotor and cognitive tests, and most of these differences were on patient estimates of how well they did on the tests rather than in actual performance. Patients in the earlier study by Friedman (1964) were generally better educated than patients in the present study which may account, in part, for the differences in results between the two studies. The Friedman study also led us to expect patients to deprecate their actual performance on the tests by underestimating how well they did. Some evidence of this was apparent in their tendency to overestimate the time it took them to complete the unpaced digit symbol subtest which has a 120-second time limit, and in their estimate of time spent on the area tapping test. The actual time difference between patients and normals on the area tapping test was not significant under both the non-speed and speed conditions. However, it is also interesting that patients had fewer dots in circles in the Aiming Test than normals, and this difference was also reflected in their estimates of the number of dots they had placed in circles. Hence, in this instance their low estimate is an accurate reflection of their actual performance rather than an example of a low level of aspiration or feelings of inadequacy.

Table 4

Significant Age-Group Differences on Cognitive and Psychomotor Tests

Variable	Under 40		40 Plus		F-ratio	Difference^{c}
	Pt(1)	Norm(2)	Pt(3)	Norm(4)		
Number	139	31	138	81

[b] Significant at .01 level (2-tailed).

[c] Comma indicates no significant difference; dash indicate significant difference.

Differences between the patients and normals emerged on psychomotor and perceptual tasks in which speed, fine eye-hand coordination, or accuracy were important. In this context it is interesting that the patients performed significantly *better* than the normals on finger tapping under the free condition, i.e., under instructions to tap at a rate that was "comfortable" for them. Hence, they were not deficient in psychomotor performance per se, but deficits did appear when they needed to sustain attention and concentration or where other factors such as energy or motivation were important. As expected, the depressed patients did appear to have more difficulty with the paced digit symbol subtest than with the unpaced version of this test. However, their difficulty was primarily in errors generated and in accuracy which dropped from 95 percent under the unpaced condition to 69 percent under the paced condition. The drop in accuracy for the normal subjects was from 99 to 86 percent which was not nearly as dramatic a drop.

Perceptual flexibility as reflected on Clock Reversal of the Stroop Test and the Shift Test was also an area where there were consistent differences favoring the normal subjects over the patients.

Concrete thinking as measured by the Concrete Sum on the Gorham Proverbs Test was also more prevalent in the depressed sample than in the normals. There were also deficits in the ability of depressed patients to learn nonsense syllables. They not only learned fewer correct symbols but were also more cautious than the normals in guessing at possible correct symbols following the presentation period on the memory drum.

Age-Group Differences

There were 10 significant age-group differences (*see* Table 4). As indicated in the "Difference" column in Table 4, the over-40 patients were most dissimilar from the other groups. They performed slower, with less accuracy, and showed more perceptual rigidity and concreteness in thinking than normal subjects in the same age group. It is also noteworthy that on a number of measures, normal subjects over 40 did as well or better than the under-40 normals. Hence, although age per se plays some role in psychomotor and cognitive decline, it is the combination of age and depression that seems to have the greatest negative impact on skills in these areas.

Sex-Group Differences

There were only six significant sex-group differences, and in four of these the significant difference was between male patients and male normals. Although the range tests were not significant, the trend in the two other scores was also in the same direction, i.e., with the normal males performing better than the male patients.

Discussion

These results provide compelling evidence that depression does have a negative effect on psychomotor and cognitive skills. The deficits appear to be very general and include tasks requiring sustained effort and concentration, perceptual flexibility or fluidity, abstract thinking, motivation, and accuracy. Simple motor tasks such as finger tapping were not adversely affected by the depression. The results indicate that there is also a tendency for depressed patients to undervalue or deprecate their performance but, in contrast to Friedman's (1964) earlier results, there was some basis in fact for this view, i.e., depressed patients did perform more poorly than their normal counterparts.

The deficits noted in the depressed patients were more pronounced in older patients and the differences were more striking between male patients and male normals than between female patients and female normals. Uhlenhuth (1981) also found a sex difference in the psychomotor performance of depressed patients. He found male depressed patients less efficient than normal men in performing even simple repetitive tasks under various schedules of positive reinforcement. However, depressed women performed more efficiently than their normal counterparts.

There was a general trend in the study for older subjects (patients and normals) to perform poorly on the psychomotor and cognitive tests and for women to perform more poorly than men. Depression tends to magnify these existing age and sex differences but in a somewhat selective fashion. Older depressed patients did more poorly than older normals and male depressed patients performed more poorly than normal males. Dif-

Table 5

Significant Sex-Group Differences on Cognitive and Psychomotor Tests

Variable		Female		Male			
		Pt(1)	Norm(2)	Pt(3)	Norm(4)	F-ratio	Difference[c]
	Number	189	74	88	38

ferences were less pronounced between under-40 depressed patients and normals and between female depressed patients and female normals. Hence, it is the patients who are either beginning to experience declines in performance and cognitive skills (older patients) or who have the greatest premorbid strengths in these areas (males) who show the greatest vulnerability to the negative effects of depressive illness.

Although the present study was designed to test a variety of hypotheses related to the effects of depression on psychomotor performance and cognitive skills, this effort was essentially atheoretical. However, study results, particularly the findings that perceptual rigidity and concrete thinking appear to be very prevalent in moderately to severely depressed patients, suggest a possible organic basis for the depression in many of these patients. This is not a new or original thought, but it would be very interesting to select a sample of depressed patients who do poorly on tests such as the Gorham Proverbs and Stroop Color-Naming Test and conduct positron emmission tomography (PET) scans on these patients as has recently been done with schizophrenics.

Desglycinamide-9-Arginine-8-Vasopressin (DGAVP, Organon 5667) in Cognitively Impaired Patients[1]

Jared R. Tinklenberg, M.D.,[2] Robert Pigache, M.D.,[3] Philip A. Berger, M.D.,[2] and Bert S. Kopell, M.D.[2]

Animal studies and some human trials indicate that vasopressin (VP) peptides can enhance learning and memory in certain conditions (Tinklenberg et al., in press). The following describes a small clinical trial of one VP peptide, desglycinamide-9-arginine-8-vasopressin (D AVP, Organon 5667), which is of interest because animal studies indicate it is devoid of cardiovascular and antidiuretic hormone (ADH) activity, while retaining behavioral effects (van Riezen 1978).

Method

Eleven men over the age of 50 who had mild to moderate cognitive impairment were studied. They were unable to function occupationally, but could still live independently, did not become disoriented in familiar settings, and showed no marked personality deterioration. The criteria were designed to exclude anyone with severe cognitive limitations or anyone who had always demonstrated low levels of intellectual functioning.

Seven subjects satisfied the Diagnostic and Statistical Manual (DSM-III) requirements for Primary Degenerative Dementia (PDD) (290.10) and met the following additional criteria: insidious onset before age 65 with memory impairment as the initial feature, progressive dementia without stepwise deterioration for at least 2 years before his study, and a Hachinski score of less than 4. There was no evidence suggesting other causes of dementia, i.e., no cerebral vascular symptoms or signs, hypertension, or other cardiovascular disease, alcoholism, drug abuse, head trauma, epilepsy, or mental retardation. There were no localizing signs on EEG, CT, or neurological exams. X-ray and laboratory exams including B12, T3, T4, and folic acid were normal. There was no indication of significant depression or other psychiatric disturbances on two independent exams.

[3] Scientific Development Group, Organon, International, Os The Netherlands.

Four patients satisfied the DSM-III requirements for Dementia Associated with Alcoholism (291.22). As with PDD, other causes of dementia were excluded by history, physical, and laboratory exams. There was at least one hospitalization explicitly for alcoholism.

The learning and memory measures, which were chosen on the basis of demonstrated sensitivity to VP or cholinomimetics, were: A 12-word high and low imagery selective reminding learning task and a 20-word delayed free-recall task. To prevent rehearsal between the presentation of the 20 words and their recall 12 minutes later, the subjects were engaged in a distractor task. Behavior and mood were assessed with the Hamilton Depression Scale (Ham-D), Profile of Mood States (POMS), the Sandoz Clinical Assessment -Geriatric (SCAG), and the Nurses Observation Scale for Inpatient Evaluation (NOSIE). The study was conducted at the Stanford Mental Health Clinical Research Center, an inpatient unit at the Palo Alto Veterans Administration Medical Center.

Daily measures of vital parameters and frequent laboratory assessments were also made. After baseline assessments, patients were stratified according to diagnosis and then randomly assigned to one of two parallel groups. Four PDD patients were assigned to the active group and three to placebo. Two alcohol patients were assigned to each treatment group. Each treatment group received placebo DGAVP spray intranasally (i.n.) three times a day (t.i.d.) for 5 days. Then the placebo group continued to receive placebo treatment for 5 more days, whereas the active group received DGAVP 92 μg i.n., t.i.d. (about 202 μg/-day free peptide) for the same period. The measures of learning, memory, mood, and general behavior were obtained during baseline, three times during the first treatment period (when both groups received placebo) and three times during the second treatment period.

Results

Preliminary analyses indicated there were no significant differences between the PDD and alcoholic groups, so the two were combined according to which treatment they received. As indicated in the Table, DGAVP did not enhance overall group performance on the two verbal learning measures. Subjects receiving active treatment did remember words with low imagery value better than placebo subjects, but this trend did not reach statistical significance.

Subjects receiving active treatment did improve clinically as indicated by somewhat better scores on the SCAG, but the magnitude of this improvement was small. The Ham-D and POMS-vigor subscale changes suggest the possibility of DGAVP inducing central nervous system stimulation but, again, any such effect was not pronounced. There were no indications of any DGAVP-related side effects and no evidence for pressor or antidiuretic activity.

Comment

The results of this study combined with those of the authors' previous DGAVP study (Tinklenberg et al. 1982) indicate that any effects of this dosage schedule may be too small to be of clinical significance. Since the few patients who did improve during the active treatment period generally had higher scores on initial measures of depression, the possibility of this VP peptide inducing mild mood elevation should be considered, especially since other VP peptides may ameliorate certain forms of depression (Gold et al. 1979). The failure of PDD patients to respond significantly to DGAVP in this study is consistent with unimpressive findings in two earlier studies of related VP peptides lysine-vasopressin and desamino-8-D-arginine vasopressin (DDAVP) in PDD patients (Chase et al. 1982; Tamminga et al. 1981; Tinklenberg et al. 1982). However, these unconvincing results are in contrast to the recent positive treatment of very early PDD pa-

Table

		Mean of First Treatment Period (Placebo/Placebo)	Mean of Second Treatment Period (DGAVP/Placebo)	Standard Error of Difference
12-Word Selective Reminding Learning Total Recall	Active Group (*N* = 6)	8.56	8.78	
	Placebo Group (*N* = 5)	7.0	7.4	0.35
20-Word Delayed Free Recall	Active Group	2.22	2.22	
	Placebo Group	2.93	3.73	0.93
Sandoz Clinical Assessment Geriatric (SCAG)[a]	Active Group	40.6	37.6	
	Placebo Group	31.9	31.6	0.99

How Does Methylphenidate (MP) Affect Information Processing in Man?

Enoch Callaway, M.D.[1] Roy Halliday, Ph.D.,[1]
Shirley Peeke, Ph.D.,[1] and Victor Reus, M.D.[1]

The purpose of this paper is to argue that methylphenidate (MP) and probably other short-acting stimulants act on response-related processes at the output end of information flow and that they have little effect on input function such as stimulus evaluation.

The latency of the P3 component in the average evoked potential appears to reflect time spent evaluating the stimulus. For example, degrading the quality of a stimulus slows both reaction time and P3. Response factors such as response competition, response readiness, and response complexity influence reaction time as do stimulus related factors. However, in contrast to stimulus related factors, these response related factors do not influence P3 latency (McCarthy & Donchin 1981).

The authors found that MP speeded reaction time in a group of older hyperactive children but had no effect on the latency of the visual evoked potential P3 component. By contrast, when the comparisons were made between children, reaction time and the P3 latency were strongly related. Apparently the changes due to maturation and P3 latency influenced both reaction time and P3 latency, while changes induced by MP only affected reaction time and did not affect P3. This is illustrated in the Figure. Thus, maturation seems to speed stimulus evaluation, since it speeds both P3 latency and reaction time. MP seems to speed reaction time without influencing stimulus evaluation as indicated by P3 latency.

Another study of hyperactive children done in this laboratory also suggested that MP is not effective in altering perceptual processes. In this study moderate doses of MP improved memory performance. By contrast, MP had no effect on a span of apprehension test. This latter task requires searching a tachistoscopically projected array for a hidden item. Presumably, performance on this task is a function of speed in perceptual processing.

The fact that P3 latency reflects stimulus evaluation and methylphenidate does not affect P3 latency is further illustrated in another study from this laboratory. This one involved eight women between the ages of 30 and 40. A test was designed to include two levels of stimulus complexity and two levels of response complexity that could be combined to provide four difference tasks. The easy stimulus was an "X" that appeared in any one of four possible horizontal positions. The hard stimuli consisted of the "X" target with three stars which occupied the other three positions. Easy response consisted of pressing one key every time an X appeared. The hard response consisted of pressing one of four keys depending on the horizontal location of the target.

Reaction times and latencies of P3 were collected for all four tasks both before and 45 minutes after taking a pill. The pill contained either a placebo or MP in doses of 5, 10, or 20 mg.

MP speeded RT for all tasks but did not change P3 latency. Increasing both stimulus complexity and response complexity showed reaction time. The increase of stimulus complexity also increased P3 latency, but response complexity did not. Thus, MP acts after the processes involved in stimulus evaluation have been completed.

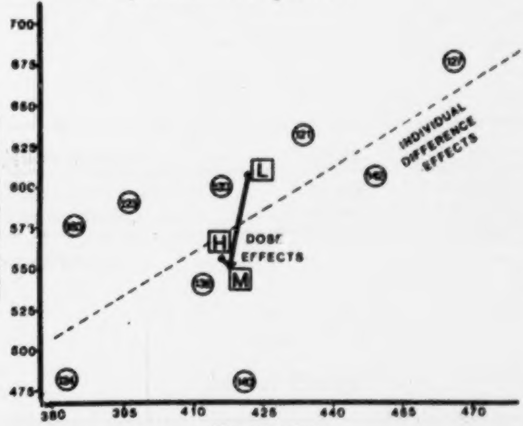

FIGURE: Effects of MP and maturation on reaction time and P3 latency. 0= average across doses of MP for individual subjects. Figure in circle is age in months. / /= average across subjects for each dose. L=Low .16 mg/kg. M=Medium .33 mg/kg. H=High .66 mg/kg.

---

[1] Langley Porter Psychiatric Institute, University of California, San Francisco Medical Center, San Francisco, CA 94143.

The notion that MP speeds response-related operations is consistent with reports in the literature. For example, Mohs et al. (1978) presented rows of print that were to be scanned for a single character and reported that a short-acting stimulant speeded this ordered search. Frowein (1981) has reported that amphetamine did not react with stimulus variables in a series of tasks where varying degrees of stimulus response complexity were combined. However, it did speed the motor response component of this task.

To summarize, then, the available data suggest that MP and perhaps other stimulants do not influence stimulus evaluation processes, but rather act on the performance end of the stimulus/response arc.

Parental Reports of Adverse Responses to Food Substances in Child Psychiatry Patients and Normal Controls

Jovan G. Simeon, M.D.,[1,2] H. Bruce Ferguson, Ph.D.,[1,3] Carole Anne Ralph,[1] and D. Mistry, M.D.[1]

Adverse responses to food substances have long been implicated as etiological factors of hyperactivity, conduct problems, and learning disorders in children. Most of the claims in the older literature associating food substances and behavior disorders are based on poor scientific methodology and anecdotal reports. An important drawback in research regarding allergic reactions has been the lack of reliable and valid diagnostic tests and criteria for allergies. Nevertheless, in the past decade, the popularity of this general approach has grown and publications advocating special diets for children with hyperkinetic and learning disorders have proliferated in North America. Such dietary management has been reported to result in relief of chronic disabling mental and physical symptoms (Crook 1980; Feingold 1975; Rapp 1979).

Controlled research studies examining hypotheses of detrimental effects of general food allergies (Trites et al. 1980) or adverse responses (of an unknown nature) to dyes and additives (Conners 1980; Goyette et al. 1978; Harley et al. 1978) have reported generally negative findings. There seems to be some agreement that a small proportion of children, perhaps the younger ones, are affected adversely by these latter substances. However, this conclusion leaves the clinician in a difficult position until valid and reliable diagnostic tests are evolved. To obtain a different perspective on the seriousness of the problem of adverse responses to food substances for child psychiatry, the authors compared parental reports

of such responses in a psychiatric sample with those of a control sample of unscreened school children. Their research hypothesis was that if adverse responses to food substances were an important etiological contributor to psychiatric problems in children, then parental reports of a referral sample ought to reveal a higher frequency of such associations than parental reports from a control sample.

Method

Psychiatric Referral Sample

Two hundred "active" files were selected from the records of the Children's Outpatient Psychiatric Department, Royal Ottawa Hospital. Current addresses were available for 190 of these children and questionnaires regarding any adverse responses to food substances and allergies were mailed out with stamped, return envelopes.

Control Sample

Permission was obtained from the Ottawa Board of Education to distribute questionnaires to elementary school students. Five hundred children, approximately evenly distributed through Grades 1 - 6 (age - 6.5-11.5) were given cover letters and questionnaires with stamped, return envelopes. All these children were in two schools chosen in consultation with Board officials to represent a broad range of socioeconomic status variables.

Questionnaires also obtained information about the child's age and sex, sibling sex and age, medical and academic problems, and allergic responses among family members.

Table 1

Number (and Percent) of Questionnaires Returned by Group

	Sent Out	Returned	Percent Returned
Psychiatric Group	190	57	30.0
Control Group	500	192	38.4

$X^2 = 3.85$ $p < .05$

Results

Response Rate

The response rate of the control sample was significantly higher than that of the psychiatric group (*see* Table 1).

Age Characteristics of Groups

The age range of the psychiatric group was 6-18 years with only 8 of 57 returned forms for children over 13. Those returning questionnaires in the school group had an age range of 5-13 years with relatively few children aged 5, 12, or 13. For the purpose of group comparison, age was divided into "young"(5-8 years inclusive) and "old"(9+ years) categories. The significant chi-square (*see* Table 2) reflects the preponderance of the psychiatric group in the "old" category, while the control sample was evenly split with regard to age.

Sex

There were relatively more males in the psychiatric group. This difference was significant (*see* Table 3) and is consistent with the generally accepted preponderance of boys in child psychiatric populations.

Table 2

Age by Group

Number (percent)	Young	Old
Psychiatric Group	14 (25)	43 (75)
Control Group	93 (48)	96 (52)

$X^2 = 9.28$ $p < .01$

Table 3

Sex of Group

Number (percent)	Male	Female
Psychiatric Group	44 (77)	13 (23)
Control Group	90 (47)	102 (53)

$X^2 = 15.09$ $p < .01$

Reported Adverse Responses or Allergies

Frequency of reported allergies was first examined collapsing across age and sex. The categories examined were: a) reaction only to foods; b) reaction to foods plus has allergies to other substances; and c) reaction to foods or has allergy to other substance. Although the rate of reported reactions was higher for the psychiatric group, there were no significant differences between groups (chi-square). Expressing the frequency of adverse responses to food as a proportion of all reported adverse effects (psychiatric group: 17/28-61 percent; control group: 39/79-49 percent) again revealed no significant difference between the groups.

Adverse Responses or Allergies: Group × Sex: Separate 2 × 2 comparisons of the groups for each sex showed no significant differences, despite the increased difference between groups for males on some variables (*see* Table 4). In addition, there was no difference between groups on adverse responses to foods expressed as a proportion of other allergies.

Table 4

Type of Adverse Response/Allergy as a Function of Group and Sex

Number (percent)	Psychiatric Group		Control Group	
	Male (*N* = 44)	Female (*N* = 13)	Male (*N* = 90)	Female (*N* = 102)
Reacts to food only	5 (11)	0 (0)	8 (9)	15 (15)
Reacts to food *plus* other	14 (32)	3 (23)	17 (18)	22 (22)
Reacts to other only	3 (7)	3 (23)	12 (13)	5 (5)
Reacts to food *or* other	22 (50)	6 (46)	37 (40)	42 (41)

Adverse Responses or Allergies: Group × Age: Although some of the psychiatric group values appeared higher for "young" subjects (*see* Table 5), the small number of psychiatric group children in this category make these figures unreliable. Once again, separate 2 × 2 chi-square comparisons of the groups for each age category showed no difference on any variable. In addition, there was no difference for adverse responses to food expressed as a proportion of other allergies.

Table 5

Type of Adverse Response/Allergy as a Function of Group and Age

Number (percent)	Psychiatric Group		Control Grou	
	Young (*N* = 14)	Old (*N* = 43)	Young (*N* = 93)	Old (*N* =
Reacts to food only	2 (14)	3 (7)	15 (16)	8 (9)
Reacts to food *plus* other	5 (36)	12 (28)	18 (19)	21 (21)
Reacts to other food	1 (7)	4 (9)	2 (2)	15 (15)
Reacts to food *or* other	8 (57)	19 (44)	35 (38)	44 (44)

Type of Symptom Shown to Food Substances

Symptoms were divided into three categories: a) physical symptoms, e.g., nausea; b) behavioral symptoms, e.g., hyperactivity, irritability; c) both physical and behavioral. In addition, the behavioral and "both" categories were combined to give a "total behavioral" symptoms category. The small numbers involved made it necessary to carry out this analysis collapsed across age and sex. Again, though the psychiatric group rates were higher for some variables (both, total behavioral), there were no statistically significant differences.

Substances Causing Symptoms

Both groups were sensitive to the same substances, both food and non-food. An exception was the high incidence of problems of the psychiatric group with pollens (15 vs. 4). Another point of note is that "sweets" (sugar plus chocolate) were reported to cause problems for twice as many children as food dyes or additives (25 vs. 11).

Role of Adverse Responses in Problems

Since the psychiatric group by definition had all been referred for emotional/behavioral/school problems, the role of adverse responses in producing medical, emotional, and school problems was examined in the school group (*see* Table 6).

Chi-square comparisons showed that the "food plus" group had significantly more medical and emotional problems than the "other" or "none" groups and that the "food plus" group had significantly more school problems than the "none" group only ($p < .05$). Thus, it appears that such reports of adverse responses to foods and other substances may indeed be related to incidence of such problems.

Table 6

Type of Adverse Response in the School Group

Number (percent) Adverse Response to:		Problem Area	
	Medical	Emotional	School
Food only ($N = 21$)	6 (29)	1 (5)	5 (24)
Food plus other ($N = 15$)	10 (67)	5 (33)	7 (47)
Other ($N = 41$)	13 (32)	3 (7)	8 (20)
None ($N = 102$)	17 (17)	7 (7)	18 (18)

Relation to Family Problems with Allergies

Only one psychiatric subject had a family member with adverse responses to food, while seven school subjects had family members with such responses. All eight of these children had adverse responses to foods. No family of a child without adverse responses reported a family member with an adverse response to a food substance.

The incidence of reported "allergies" among family members was higher among families of children reported to have adverse responses or allergies (78 vs. 53 percent). Whether or not the child showed adverse responses, the incidence of allergies reported for family members is about 10 percent higher in the school sample. However, chi-square analysis indicated that there were no significant differences between the psychiatric and school groups among subjects either with or without adverse responses.

Conclusion

The most noteworthy finding was the similarity between psychiatric and school groups in frequency and type of adverse responses and the substances to which they were reported to respond. While the problems appeared to be relatively more marked for boys and "young" subjects in the psychiatric sample, these differences did not reach significance. However, some care must be exercised in interpreting these results. Neither sample produced a satisfactory response rate and the school group's response rate was higher than the psychiatric group's. This low response rate leaves open the possibility that real differences in the populations are masked by some unknown sampling bias. Finally, the data showing that children in the school group with adverse responses to food and other substances were reported to have more problems than other children suggests that such adverse responses may indeed play some role in producing physical, behavioral, and school problems.

Classical Conditioning of Cocaine's Stimulatory Effects

Wagner H. Bridger, M.D.,[1] Stanley R. Schiff, M.D.,[1] Stanley S. Cooper, M.D.,[1] William Paredes, M.D.,[2] and Gordon A. Barr, M.D.[1]

The ability of environmental cues that become associated with drug administration to elicit behaviors originally due to the drug alone is well established. Pavlov (in 1927) first suggested that cues paired with drug treatment could be viewed as conditioned stimuli within the framework of classical conditioning.

However, although conditioning of opiates effects is now well accepted, the ability of conditioned stimuli to elicit stimulant-like behavior is not as established. (Irwin & Armstrong 1961; Pickins & Crowder 1967; Pickens & Dougherty 1973; Pilil & Altman 1971; Schiff, in press; Segal 1975; Tilson & Rech 1973). More recently, Post and his colleagues have argued that conditioned stimuli alone are not able to elicit increased activity and stereotypic behaviors typical of cocaine (Post & Rose 1976; Post et al. 1981). On the other hand, stimuli associated with reinforcing intravenous infusions of cocaine act as "priming" doses to facilitate responding for cocaine during extinction (deWit & Stewart 1981).

In the present series of experiments, the following questions were asked: 1) Can stereotyped behavior and hyperactivity elicited by cocaine be classically conditioned? 2) For how long can the conditioned stimuli continue to elicit cocaine-like behaviors with and without extinction?

Experiment I

Male Long-Evans hooded rats from Blue Spruce Farms (Altamont, N.Y.) aged about 90 days, were used. Two groups of rats, conditioned and pseudoconditioned controls, were used for all experiments. Both groups were given training trials in which they were placed into a 10-gallon glass aquarium for 1 minute during which time a tone which served as a conditioned stimulus was presented (2800 Hz Sonalert). Following this, the rats were injected with either 15.0 mg/kg cocaine HCL (Malincrodt) or 0.9 percent saline (1ml/kg) and placed into the second aquarium in a separate room. This procedure was done on 10 consecutive days. On the test day the procedures were identical except that all animals were injected with saline. After each training session, animals were returned to their home cages where they received, approximately 1 hour later, an injection of the opposite drug or vehicle. This served to equate the amount of cocaine received by both groups.

Seven separate behaviors were measured by an experienced rater blind to the experimental conditions through a one-way mirror from a separate room. These behaviors have been defined previously (Schiff, in press). Separate behaviors were measured rather than combining them into a single "stereotypy" score, because most stereotypy scales are defined to be linear and interval scales rather than being empirically derived as such. Thus, they are examples of what Torgerson (1967) calls measurement by fiat. Second, the authors and others (Costall & Naylor 1980; Eichler et al. 1980; Iverson 1977; Schiff 1980) reported that individual stereotyped behaviors may be mediated by different physiological systems.

Because there existed some question about the ability of conditioned stimuli to elicit increased activity and stereotypy, the initial experiment was designed to determine if, using the authors' methods, conditioned cocaine-like effects could be demonstrated.

Results

The conditioned group was compared to the pseudoconditioned group for each behavior by independent *t*-tests. These data are presented in the first table. Seven of the eight behaviors showed significant differences between groups, with licking not being conditioned.

Experiment II

It was established in the first experiment that seven of eight behaviors elicited by cocaine could be conditioned. Yet, for these findings to have practical significance it is necessary, although not sufficient, to demonstrate that the conditioned effect has some permanence. In this second experiment, we delayed testing the animals with saline for 5 days to see if the conditioned effect would last that long. Since it did, we tested twice more at 5-day intervals.

[2] Department of Psychology, Hunter College, City University of New York, New York, NY 10021.

The methods were similar to those in the first experiment except that the initial test day was 5 days after the 10th training day rather than 1 day. Subsequent test days (saline injections) were 10 and 15 days posttraining.

Results

The data were analyzed by a two-way analysis of variance (Group × Day of testing) with particular attention paid to the interaction term. First, licking, grooming, and chewing did not show significant differences between groups and also failed to show significant interactions ($p < .05$). This suggests that the conditioned drug effects were dissipated by the first day of testing, Day 5, for these two behaviors; licking failed to show conditioning in Experiment 1. Sniffing and head-bobbing both demonstrated significant

Table 1

Behaviors Elicited by the CS for Conditioned and Pseudoconditioned Groups

		0.72	3.47	0.75	4.89	4.07	3.10	0.76	1.16
Pseudo-Condit. Group	5	2.56	33.51	5.27	45.98	27.12	11.98	3.25	4.04
		0.97	4.26	2.20	5.15	6.92	3.88	0.81	0.91
	10	2.40	27.79	2.89	43.15	28.28	9.17	2.46	2.92
		1.13	6.29	1.39	9.06	7.49	3.59	0.84	1.06
	15	3.22	41.64	4.48	63.01	22.39	15.45	4.16	5.91
		0.78	5.29	1.64	5.79	8.11	4.15	0.94	0.82

Note- Entries are Means and Standard Errors of the Mean in seconds/120 second period except for crossings and rearing frequencies which are numbers/120 second period. For statistics see text. $N = 8$/group.

group effects ($p < .001$) and significant interactions ($p < .05$). Subsequent analysis of the interactions by tests of simple main effects (Kirk 1968) showed that there were significant differences between groups on Days 5 and 10 but not on Day 15. Finally, the number of crossings and the frequency of rearing showed significant group differences but failed to show significant interactions (although there was a trend for a significant interaction for crossing, $p < .09$). This suggests that any decay for these two behaviors over the 15 days was minimal. The data are presented in Table 2.

Experiment III

In part because the second experiment which studied decay of the conditioned response contained an extinction component, and in part to determine if the conditioned effect could be decreased by extinction, the conditioned stimuli was presented without the unconditioned stimulus for 4 consecutive days. The ability or inability to extinguish the conditioned response could have implications for the treatment of stimulant abusers. The methods were identical to those of the second experiment, except that there were 4 consecutive test days beginning with Day 11.

Results

Data were analyzed in an identical manner to those in the second experiment. An analysis of variance was done on the data with a significant interaction indicating differential changes in the two groups over the 4 days of testing. This analysis failed to show significant differences between the conditioned and pseudo-conditioned groups for licking, chewing, or grooming. For licking this was a replication of the failure of this behavior to condition, but for the latter two behaviors it indicates caution in concluding that these two behaviors reliably condition. Rearing time only showed a trend towards conditioning ($p < .07$) and the comments above also apply here. Rearing frequency, crossings, sniffing, and head bobbing all showed significant group differences ($p < .05$, $< .01$, $< .001$, $< .05$, respectively) but no behavior showed any significant interactions or trends towards significant interactions ($p < .10$). Again, while nonsignificant differences must be interpreted with caution, this suggests that these behaviors did not show major extinction during the 4 extinction days. Table 3 presents the data.

Table 3

Differences Between Conditioned and Unconditioned Groups to the CS During 4 Days of Extinction

	Day	Licking	Head Bobbing	Chewing	Sniffing	Grooming	Rearing Time	Rearing Frequency	Crossing

Discussion

The results of these experiments demonstrate that cocaine-like behaviors can be readily elicited by previously neutral stimuli that had been paired with cocaine and that these effects, for some of the behaviors, are stable over time.

The differences between the results found here and those of Post and his colleagues are likely due to one of two major methodological differences (Post & Rose 1976; Post et al. 1981). Conditioned stimuli were presented for the experimental group only with cocaine. In contrast, the National Institute of Mental Health (NIMH) group allowed 20 minutes of adaptation to the test chamber prior to drug injection. Thus, along with each conditioning trial was an extinction period. Others have reported relatively rapid extinction of the enhancement of cocaine's effects by conditioned stimuli (Hinson & Poulos 1981). Moreover, the authors attempted to increase the likelihood of conditioning by having multiple conditioned stimuli such as tone, injection, novel chamber, and removal to the observation room. It is likely that the conditioned drug effect requires these multiple cues.

A second procedural difference is the dependent measure. We examined individual behaviors and found that not all conditioned with equal ease. Most other investigators have used rating scales that combine behaviors. That some behaviors show more conditioning than others supports the argument that the different behavioral components of stereotyped behaviors may have different anatomical or chemical substrates.

These data have implications for the etiology and treatment of drug-seeking behavior. There are two ways in which environmental stimuli can affect stimulant abuse. The first is the enhancement of stimulant action by association with environmental cues (Hinson & Poulos 1981; Post & Rose 1976; Post et al. 1981; Segal & Mandell 1974). This may contribute substantially to resultant drug actions, including hyperactivity, stereotypy, and convulsions (Post et al. 1981). However, an equally important component is the role of these same environmental cues in the absence of drug. These cues can result in behavioral and presumably physiological effects that mimic the stimulant. In as much as "priming" doses of drug can lead to drug-seeking behavior in animals (Davis & Smith 1976; deWit & Stewart 1981; Gerber & Stretch 1975; Pickens & Harris 1968), stimuli associated with drug intake in a Pavlovian manner can also do the same (deWit & Stewart 1981). For opiates, the role of these stimuli in recidivism has been recognized. The authors suggest that similar processes may be functioning for stimulant abuse.

Naloxone Potentiates Cocaine Effect in Man

Robert Byck, M.D.,[1,3] Alan Ruskis, M.D.,[2] James Ungerer,[3] and Peter Jatlow, M.D.[3,4]

The effects of cocaine on mood and physiological parameters in man are well established. Naloxone (an opioid antagonist) has minimal mood and cardiovascular effects. The proposal for a common mechanism of euphoria mediated by endorphins (Byck 1976) would imply a possible block of cocaine euphorigenic effects by naloxone. Similar reasoning by Huey et al.(1980) led to an experiment examining the effects of naloxone on methylphenidate-induced mood enhancement. No block was found, but some effects of methylphenidate appeared to be enhanced, although not at a statistically significant level.

The authors examined the effects of 20 mg IV naloxone on mood and physiological parameters on seven male volunteers who had received 2 mg/kg cocaine intranasally. Cocaine effects in the predictable directions occurred, but naloxone given at 15 minutes after cocaine enhanced rather than blocked cocaine "high;" there was an increase in "euphoria" and a depression of "lethargy," "malaise," and other psychological measures consistent with enhanced cocaine effect. The effect on physiological parameters was variable. When naloxone was given at 5 minutes before cocaine or 25 minutes after cocaine, no significant changes in cocaine effects were seen.

Holaday and others (Faden et al. 1981) have reported naloxone reversal of endotoxin and spinal shock by a postulated central dopaminergic mechanism. The authors suspect that their observed potentiation of cocaine effect occurs by a similar dopaminergic mechanism and that administration of cocaine or methylphenidate "sets up" a dopamine agonist response to naloxone similar to that caused by shock-inducing mechanisms.

The apparent necessity for naloxone dosage to follow cocaine rather than precede it implies a

cocaine effect on a naloxone sensitive system which may not be a traditional opiate receptor mechanism. Since naloxone effects are, if anything, the reverse of cocaine effects, the finding of a potentiation is clearly more than an additive interaction.

Rapid Acquisition of Conditioned Responses to Hydromorphone in Detoxified Heroin Addicts

Joseph W. Ternes, Ph.D.,[1] Charles P. O'Brien, M.D., Ph.D.,[1] and Thomas T. Testa, Ph.D.[1]

A Pavlovian conditioning procedure was used to study conditioned drug states in human subjects. Six recently detoxified heroin addicts received six training trials in which two arbitrarily selected stimuli, a strawberry-flavored solution and a 700 Hertz (Hz) tone, were used to signal an infusion of 4 mg of hydromorphone.

Subjects' verbal reports of craving, withdrawal, and high, and two autonomic variables, skin temperature and pupil diameters, were recorded to assess the effects of this training. The unconditioned response to hydromorphone included an increase in skin temperature, pupilary constriction, reports of feeling high, and a reduction in craving and withdrawal symptoms. During *training* with hydromorphone, the conditioned stimulus (CS) elicited a mixed anticipatory response pattern. It partially resembled the unconditioned drug reaction, since the subjects reported feeling high and had fewer withdrawal symptoms. On the other hand, it partially resembled unconditioned withdrawal since they also reported an increase in craving, their pupils became dilated, and their skin temperature decreased. During *test* trials, when physiological saline was substituted for hydromorphone, both the subjective reports and autonomic variables changed in the opposite direction from the drug's unconditioned effects. Additionally, subjects displayed extreme negative affect 15 to 20 minutes after the saline infusion. The authors believe this is the phenomemon which is commonly referred to as "conditioned withdrawal."

Classical conditioning readily occurs when opiate drugs are used as unconditioned stimuli (UCSs). Thompson and Pickens (1971) demonstrated that a drug-produced state can act as an interoceptive stimulus in control of operant behaviors. Wikler (1973) observed that opiate drugs elicit compensatory physiological changes which are conditioned responses CRs. Recently Siegel (1976) demonstrated that tolerance to morphine in rats is a Pavlovian CR. Conditioning can also produce an interoceptive state which resembles abstinence symptoms and which motivates opiate-seeking behavior in detoxified addicts (Goldberg & Schuster 1970). This latter CR is sometimes called "conditioned withdrawal" (Wikler 1965).

---

[1] Department of Psychiatry, University of Pennsylvania and Veterans Administration Medical Center, Philadelphia, PA 19104.

The evidence for the phenomenon known as "conditioned withdrawal" is still somewhat speculative. Teasdale (1973) found that showing slides of drug-related scenes to post-addicts resulted in significant changes in mood. O'Brien et al. (1977) reported that conditioned abstinence symptoms were produced by pairing a tone/odor CS with naloxone injection in methadone addicts. Ternes et al. (1979) and Hugdal and Ternes (1981) have shown that naturalistic stimuli such as syringes, bags of heroin, and video sequences of self-injection were capable of eliciting electrodermal arousal and autonomic changes similar to opiate withdrawal signs in detoxified addicts. Ternes and O'Brien (1982) have also reported that when detoxified addicts were allowed to self-inject saline, autonomic changes occurred which were in opposition to the usual effects of an opiate. They argue that the syringe and self-injection procedure are naturally conditioned CSs which elicit anticipatory CRs which resemble withdrawal signs. These CRs may also be correlates of a conditioned emotional state which motivates behavior as a means of avoiding abstinence syndrome. However, to date no clear demonstration of how conditioned withdrawal responses are acquired in human subjects has been published.

The Laboratory at the Veterans Administration Drug Research center in Philadelphia has been engaged in studying the role of Pavlovian conditioned responses in human opiate addiction for the last 10 years. In earlier works, the authors have attempted to demonstrate experimental extinction of naturalistic stimuli normally associated with heroin self-administration (O'Brien et al. 1979). It could be argued, however, that what appeared to be conditioned reactions to stimuli normally associated with self-injection were in fact unconditioned arousal responses and movement artifacts which were unconditionally elicited by the syringe and the act of self-injection. The present experiment controlled for these possibilities. This was accomplished by pairing entirely arbitrary stimuli, a strawberry flavor and a 700 Hz tone, with a 4 mg dose of hydromorphone delivered within a 30-second interval as a 2 ml bolus of solution superimposed on the slow infusion of 5 percent dextrose and water which was administered throughout the session. The infusions were administered through an intravenous catheter which was inserted in the median cubital vein prior to each session. The authors believe this procedure is free from the contaminating influences of the subject's prior history of associations with self-injection. It should also be relatively free from the unconditioned arousal effects of the injection stimuli, from movements during drug administration and, finally, from the necessity to use a tourniquet.

Method

Subjects

The subjects were six male heroin addicts with a mean history of heroin use of 5.7 years. Each patient was required to detoxify completely and remain drug-free for 2 days following the last methadone dose. All subjects signed a consent form and became an inpatient on the detoxification ward at the Veterans Administration Medical Center in Philadelphia.

Apparatus

An intermittent infusion set delivered either the UCS or a placebo and was placed in the arm of the subject prior to the beginning of each test session. The administration set was connected to polyethylene tubing which was passed through an aperture in the wall to an adjoining room where it was attached to a Harvard infusion pump.

Procedure

There were 10 daily experimental sessions. Prior to each of these, the subject was prepared for physiological recordings by attaching a thermister to the right index finger. Each session was

60 minutes long. Prerecorded instructions asked the subject to rate his level of craving, high, and withdrawal in order to assess his subjective state at various points throughout the session. He was also asked to drink a flavored liquid when he heard a tone onset. The first 10 minutes of the session were silent except for the verbal self-reports which occurred at 5-minute intervals throughout the session. This constituted the session baseline period. Tone onset (65 db, 700 Hz audiogenerator) occurred at the end of this baseline period. At that time, the patient was also instructed to drink 70 ml of strawberry Hawaiian punch. The tone as well as the highly salient strawberry taste constituted a complex CS for the delivery of the drug. At the end of the 4th minute of the tone, the infusion pump was turned on. On the first 2 days (pretraining), as well as on the last 2 days (testing), physiological saline was infused instead of hydromorphone. During Sessions 3 through 8 (training), 4 mg of hydromorphone was infused. Delivery of the solution on both drug and placebo days was accomplished by a 4 cc syringe attached to a Harvard infusion pump. This was followed by a flush of 5 cc of 5 percent dextrose and water from a second 5 cc syringe, also placed in the pump. At this point, the subject was given the same set of questions. The questions were repeated at 10-minute intervals until the end of the session at minute 60.

The autonomic measures taken from all patients during the 60-minute session were: pupil size and skin temperature. Subjective reports of high, craving, and withdrawal were also elicited from the subjects by requesting a response from fixed choice questions such as: "Do you feel any high, craving, withdrawal/none, mild, moderate, extreme?"

Results

Figure 1 shows the mean change in subjective reports by the subjects after the CS was presented during each of the three conditions of the experiment: pretraining baseline, training with hydromorphone, and testing with saline. During pretraining sessions there were only slight changes in the subject's reports of craving, high, and withdrawal. When the CS was presented during *training*, craving and high increased and withdrawal decreased relative to the severity of these reports during the session baseline period. During *testing*, both craving and withdrawal increased but no reports of feeling high occurred. These results suggest that conditioned high responses were acquired during training with hydromorphone and that these CRs were accompanied by increased levels of craving and decreased withdrawal. However, when a placebo was given, subjective reports of craving were followed in time by withdrawal symptoms.

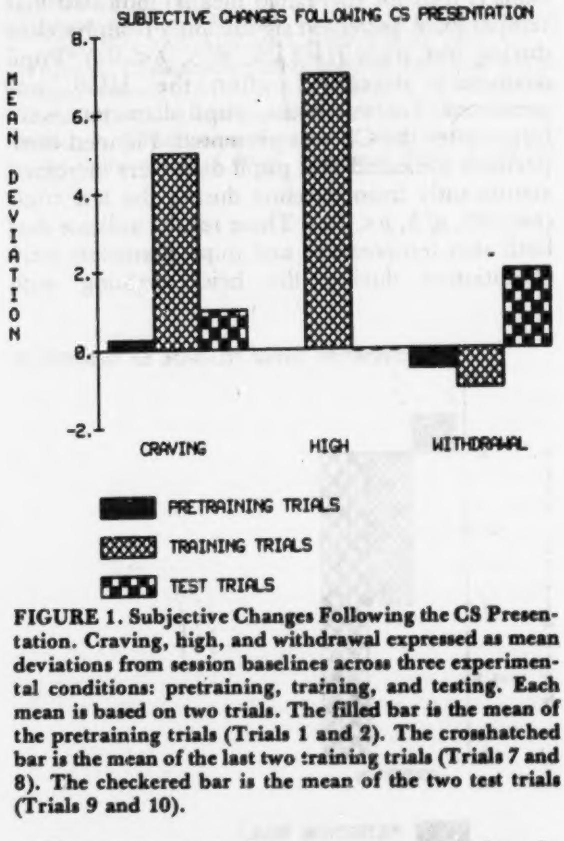

FIGURE 1. Subjective Changes Following the CS Presentation. Craving, high, and withdrawal expressed as mean deviations from session baselines across three experimental conditions: pretraining, training, and testing. Each mean is based on two trials. The filled bar is the mean of the pretraining trials (Trials 1 and 2). The crosshatched bar is the mean of the last two training trials (Trials 7 and 8). The checkered bar is the mean of the two test trials (Trials 9 and 10).

Figures 2 and 3 show the mean deviations in skin temperature and pupil diameters from session baseline which were elicited by the CS presentation during the pretraining, training, and test phases of the experiment. A slight positive change in skin temperature occurred during the pretraining trials. During training and testing, however, all of the changes in skin temperature were in a negative direction relative to the respective session baseline. Pupil diameters decreased slightly during the pretraining trials. During training and testing, all of the changes in pupil diameter were positive relative to the session baselines.

In the presence of CF, both of these autonomic variables changed in the opposite direction from the unconditioned response to hydromorphone. During training, skin temperature increased after the UCS presentation. On test trials when no drug was given, skin temperature decreased following the CS presentation. Planned comparisons (*t*-tests for correlated means) indicated that temperature decreased significantly from baseline during test trials ($t=3.25$, *df* 5, $p<.01$). Pupil diameters decreased after the UCS was presented. On test trials, pupil diameters were larger after the CS was presented. Planned comparisons indicated that pupil diameters increased significantly from baseline during the test trials ($t=2.83$, *df* 5, $p<.01$). These results indicate that both skin temperature and pupil diameters were conditioned during the brief training with hydromorphone. These results also indicate that these autonomic CRs resemble the conditioned compensatory response mechanism which both Wikler and Siegel have proposed.

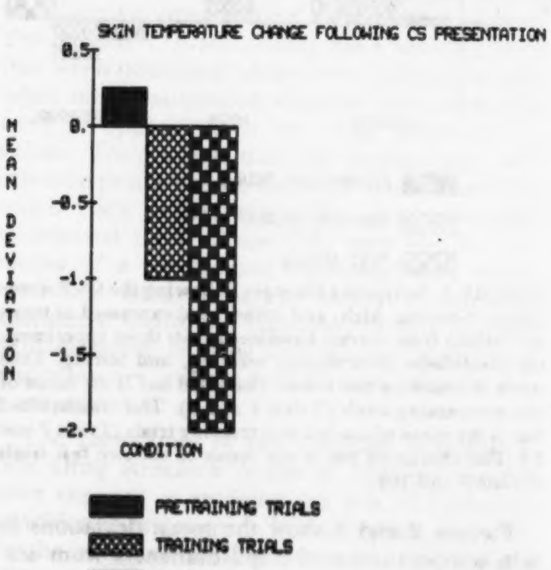

FIGURE 2. Skin Temperature Changes Following the CS Presentation. Mean deviations from session baseline periods during pretraining, training, and test trials. Each mean is based on two trials. The solid bar represents the pretraining trials. The crosshatched bar represents the training trials, and the checkered bar represents the test trials.

Discussion

The authors found that the unconditioned response to hydromorphone in detoxified addicts was skin temperature increase, pupil constriction, and reports of feeling high and attenuation of withdrawal symptoms and craving. The CS presentations during training with hydromorphone elicited anticipatory responses which preceded these drug effects. These included autonomic changes such as skin temperature decrease and pupilary dilation. Subjectively, the subjects reported feeling high, increased craving for opiates, and a reduction in withdrawal symptoms.

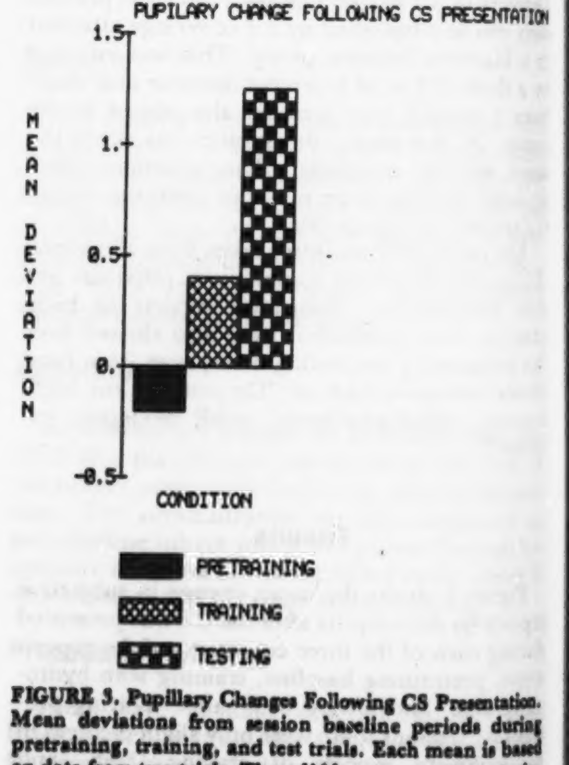

FIGURE 3. Pupillary Changes Following CS Presentation. Mean deviations from session baseline periods during pretraining, training, and test trials. Each mean is based on data from two trials. The solid bar represents pretraining trials, the crosshatched bar represents training trials, and the checkered bar represents test trials.

It was also found that during test trials, when physiological saline was infused instead of hydromorphone, CS presentation elicited skin temperature decrease, pupil dilation, and an increase in craving for opiates relative to baseline. No euphoria or high was reported. However, subjects experienced an increase in withdrawal symptoms. These results may appear contradictory, since subjects frequently reported feeling high prior to the drug infusion during training. Although they did not report feeling high on test trials, reports of withdrawal symptoms usually did not occur until 15 or 20 minutes after CS presentation. This suggests that the CS caused a brief delay in the onset of the withdrawal syndrome.

The authors believe these results indicate the complex nature of the CR to an opiate UCS in human addicts. It is comprised of both drug-negative and drug-positive components. Immediately following CS presentation, the subject may experience either euphoria or relief of withdrawal symptoms or delayed onset of withdrawal. However, in either case, eventually a negative affective reaction follows which is accompanied by an increased craving and withdrawal symptoms. Therefore the CR is essentially biphasic, a positive affective reaction followed in time by a negative reaction. Most addicts are relatively tolerant to opiates and therefore the negative component is in ascendency. This tends to reduce the initial positive drug effects when a good dose is administered. When a placebo or low dose is given, it results in labeling the negative affect as withdrawal symptoms.

Lofexidine in Abrupt Methadone Withdrawal[1]

Arnold M. Washton, Ph.D.,[2] and
Richard B. Resnick, M.D.[2]

Introduction

Previous studies have shown that the alpha-2 noradrenergic agonist, clonidine hydrochloride, is a safe and effective non-opiate treatment for opiate withdrawal and that clonidine can be extremely useful in facilitating a rapid transition from opiate dependence to aftercare treatment with the opiate antagonist, naltrexone (*see* review by Washton & Resnick 1981). However, clonidine is not without clinical risks and potential drawbacks. Clonidine's potent hypotensive and sedative effects have limited its clinical usefulness with some patients, suggesting that other alpha-2 noradrenergic agonists lacking these side effects might be safer and more efficacious.

Lofexidine hydrochloride (Merrell-Dow Pharmaceuticals) is an investigational analogue of clonidine that has been shown to significantly reduce opiate withdrawal in morphine-dependent rats (Shearman et al. 1980). Clinical testing of lofexidine as an antihypertensive agent has shown it to be less sedating and hypotensive than clonidine (Maner et al. 1980; St. John LaCorte et al. 1981). The present study was a preliminary clinical trial of lofexidine in abrupt methadone withdrawal. As in earlier studies with clonidine in this facility (Washton & Resnick 1981), the test of lofexidine's usefulness was conducted in an outpatient setting with the measure of success defined by induction onto naltrexone.

Method

The subjects were 15 methadone-dependent male outpatient volunteers who showed no evidence of medical or psychiatric illness and gave informed consent to the study which involved an abrupt switch from methadone to lofexidine. On Day 1, subjects received their usual methadone dose (10-25 mg) and began a self-administered lofexidine dose regimen of 0.1 mg two or three times daily. On Day 2, methadone was abruptly discontinued with subjects receiving a matched placebo methadone solution, and the lofexidine dosage was increased to 0.1 mg four times daily. Subsequently, the lofexidine dose was increased as needed to no more than 0.4 mg four times daily according to symptoms and side effects. All subjects were told that the detoxification procedure would take 11 days and that naltrexone could be started on Day 11 (10 days post-methadone), provided that they used no illicit opiates during the study as confirmed by the absence of a precipitated withdrawal reaction to intravenous naloxone challenge (2.0 mg) on Day 11. Subjects who did use illicit opiates during the first 10 days post-methadone were allowed to continue on lofexidine, and the naloxone challenge was postponed to the first opportunity where it posed minimal risk of precipitating a withdrawal reaction (i.e., to at least 5 days after the last opiate use) but no later than Day 21 of the study. The detoxification was considered successful if the subjects passed the naloxone challenge and started naltrexone on Days 11-21. Subjects who returned to using opiates and failed to begin naltrexone by Day 21 were considered unsuccessful.

Results

Successful detoxification and induction onto naltrexone was accomplished with 10 of the 15 subjects. All patients rated lofexidine as moderately to extremely effective in reducing most of the commonly experienced withdrawal symptoms. Insomnia, lethergy, and muscle/bone pain were the most frequent residual complaints. None of the 10 subjects reported unacceptable withdrawal symptoms while taking lofexidine. Those who failed to complete the detoxification procedure cited opiate craving rather than withdrawal discomfort as the major reason for returning to opiate use. No one reported oversedation, dizziness, or lightheadedness from lofexidine, despite rapid increases in the dose to as much as 1.6 mg per day within the first 5 days. The maximum daily lofexidine dose ranged from 0.6 mg to 1.6 mg across the 10 subjects with an average of 1.2 mg. There was no significant lowering of blood pressure (BP) even at the maximum lofexidine dose (mean prelofexidine BP, 115/74 mm Hg; mean BP at maximum dose 115/76 mm Hg). Dry mouth and mild drowsiness were the most commonly reported side effects. Upon study completion, reductions in the daily lofexidine dose by 0.2 to 0.6 mg per day produced no symptomatic complaints or significant changes in blood pressure.

Research funds were provided by the National Institute on Drug Abuse, Boehringer Ingleheim Ltd., and Merrell-Dow Pharmaceuticals, Inc.

[2] Department of Psychiatry, Division of Drug Abuse Research and Treatment, New York Medical College, New York, NY 10029.

Discussion

This open clinical trial provides preliminary evidence of lofexidine's efficacy in reducing symptoms of opiate withdrawal. The present findings are similar to earlier results with clonidine (Washton & Resnick 1981) in terms of detoxification success rates and withdrawal symptom relief, but lofexidine was found to be considerably less sedating and hypotensive. Lofexidine may therefore prove to be safer and more clinically useful than clonidine, especially in outpatient opiate detoxification. These findings suggest that lofexidine might allow opiate-addicted outpatients even greater access to naltrexone or drug-free modalities without hospital admission. A controlled study comparing lofexidine with gradual methadone detoxification is currently being conducted at this facility.

Effects of Desipramine on Diurnal Rhythms of Plasma 3-Methoxy-4-Hydroxyphenylglycol (MHPG) in Depressed Patients[1]

Edward M. DeMet, Ph.D.,[2] Angelos E. Halaris, M.D., Ph.D.,[2] Harry E. Gwirtsman, M.D.,[2] Rochelle M. Reno, Ph.D.,[2] and Phyllis I. Becker, M.D.[2]

A number of studies have suggested that manic-depressive illness may be associated with a decrease in noradrenergic activity. A noradrenergic role is supported by findings of low levels of the major norepinephrine (NE) metabolite 3-methoxy-4-hydroxyphenylglycol (MHPG) in the urine and plasma of some depressed patients (Halaris & DeMet 1979; Maas et al. 1968). MHPG changes in these fluids are believed to largely reflect changes in central NE turnover (DeMet & Halaris 1979). However, it has been shown that successful treatment of depressed patients with tricyclic antidepressants fails to produce a sustained increase in urinary MHPG levels, as might be expected if NE activity were directly related to the depressed mood state (Beckmann & Goodwin 1975; Halaris & DeMet 1980). One possible explanation for this discrepancy could be related to the fact that MHPG levels follow a circadian rhythm with elevated levels during the daytime and reduced levels during the evening and night hours (Halaris & DeMet 1981; Wehr et al. 1980). Both of the above cited studies showed that the circadian rhythm of MHPG in manic-depressive patients was phase-advanced by 1 to 2 hours as compared to normal subjects. Moreover, another study has shown that the tricyclic antidepressant, imipramine, exerts effects on diurnal rhythms of adrenergic receptor binding in rat brain (Wirz-Justice et al. 1980). In that study, chronic

imipramine treatment resulted in a phase retardation of the normal diurnal rhythms of alpha- and beta-adrenergic receptor binding. Whether the antidepressant effect of these agents is directly related to their ability to delay the phase of the diurnal rhythm of NE remains to be established.

The present investigation was undertaken to determine whether treatment with a tricyclic antidepressant might cause a phase delay of the circadian pattern of NE turnover in depressed patients. Three hospitalized depressed patients meeting Research Diagnostic Criteria (RDC) for primary major depressive disorder, endogenous type, were compared with three normal volunteers. Patients were free of any psychoactive medication for at least 3 weeks prior to the study. No attempt was made to impose dietary or activity restrictions on either patients or volunteers, since no significant effect on MHPG blood levels had been found in preliminary studies. A history of alcohol use in either patients or volunteers served as exclusion criterion, and all subjects were requested to refrain from the use of any alcoholic beverages for at least three days prior to the experiment. A log of activity and foods ingested was maintained. A written informed consent was obtained from each participant in the study. Blood samples were obtained from an indwelling antecubital catheter which was kept patent by flushing it with sterile citrate-phosphate-dextrose buffer (CPD-A). A baseline diurnal rhythm of plasma MHPG was determined for each subject using the gas chromatographic method of Halaris et al. (1977). Blood samples were collected at 3-hour intervals around the clock, with the exception that the 6 a.m. sample was omitted in the patient collections. Patients were then treated with a daily dose of 150 mg desipramine-HCl (DMI) for a total of 4 weeks. Changes in mental status and clinical improvement were determined weekly by means of the Hamilton Rating Scale for Depression. The diurnal rhythm of MHPG levels in plasma was reexamined following the fourth week of treatment.

Figure 1 shows that both the normal volunteers and the depressed patients had pronounced diurnal rhythms of plasma MHPG levels. However, the rhythms differed in the two groups, with the depressed patients leading normal controls by about 3 hours. The averaged rhythms shown for both depressed patients and normals follow a true circadian rhythm with a 24-hour periodicity. Individual normal subjects also showed sinusoidal patterns with a 24 hour periodicity. When these rhythms for the normals were averaged, the resultant curve was actually slightly distorted as compared to the individual curves due to minor differences in intra-subject amplitude variability. The opposite was true of depressed patients. Individual patients significantly deviated from a 24-hour periodicity, and several exhibited secondary peaks in the late afternoon and evening. Averaging of the individual rhythms tended to mask these differences such that a secondary peak is only barely evident in Figure 1, and the net response approximates a 24-hour period. Both the amplitudes and baselines of the MHPG rhythms were similar in the depressed and normal subjects.

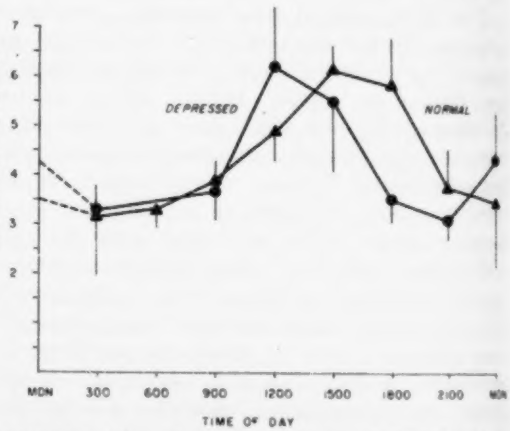

FIGURE 1. Diurnal pattern of plasma MHPG levels in three normal subjects (▲ — ▲) and three endogenously depressed patients (● — ●).

All three patients showed significant improvement with DMI treatment, as evidenced by a decrease in Hamilton rating scores (change score = 23 ± 2.08 S.E.M.). Figure 2 shows that DMI treatment resulted in the normalization of the phase of diurnal plasma MHPG rhythms. This change was accompanied by a slight reduction in both the baseline MHPG level and the amplitude of the MHPG cycle. Normalization was evident in the individual rhythms as well as in the composite sample.

The results of the present study clearly showed that plasma MHPG rhythms were phase-advanced in the three endogenously depressed patients studied. Clinical improvement with DMI treatment was associated with the normalization of the phase of the MHPG rhythm. The fact that phase normalization occurred in all three patients studied suggests that MHPG phase shifts may be specific biochemical indicators of clinical improvement. Since the amplitudes of the diurnal rhythms of normal and depressed subjects were actually more similar before DMI treatment than after, the results further suggest that behavioral normalization after tricyclic treatment may be independent of changes in the amplitude of noradrenergic activity. Finally, the present results suggest that the circadian pattern of MHPG is a state-dependent trait that may be of diagnostic value.

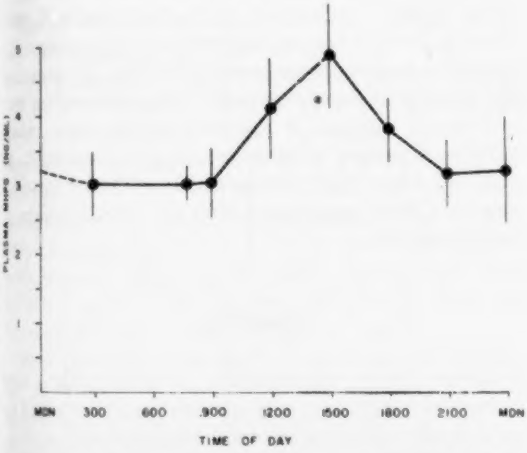

FIGURE 2. Diurnal pattern of plasma MHPG levels in the same three endogenously depressed patients after treatment with DMI.

β-Endorphin, Cortisol, and Prolactin in Serum of Schizophrenic Patients During Long-Term Neuroleptic Treatment and After Withdrawal: Relationships to Psychopathology[1]

**Dieter Naber, M.D.,[2] Margot Albus, M.D.,[2]
Franz Muller, M.D.,[2] Horst Burke, M.D.,[2]
Doris Welter,[2] Manfred Ackenheil, M.D.,[2]
and Hanns Hippius, Prof., M.D.[2]**

The effectiveness of neuroleptic maintenance therapy to prevent relapse of chronic schizophrenia is well established (Davis et al. 1976; Gardos & Cole 1976; Hogarty et al. 1976; Prien & Klett 1972; Wistedt 1981; Woggon 1979). However, there is evidence that some patients do not profit from neuroleptic treatment or even improve after withdrawal (Andrews et al. 1976; Leff & Wing 1971; Marder et al. 1979; Tobias & MacDonald 1974). With regard to the neuroleptics' serious side-effects such as tardive dyskinesia, there is a strong effort to minimize the neuroleptic dosage and to determine which patients do not require maintenance therapy.

Investigating any potential predictors for the effect of neuroleptic withdrawal in chronic schizophrenia, age of patients, duration of illness, and previous neuroleptic dosage have been found to correlate with psychopathological changes and probability of relapse (Davis et al. 1976; Marder et al. 1979; Prien & Klett 1972; Woggon 1979). In other studies, low serum level of prolactin was associated with early relapse after drug discontinuation (Brown & Laughren 1981; Zander et al. 1981). This study is an attempt to replicate these previous findings and to see whether serum levels of β-endorphin and cortisol are related to psychopathological changes after neuroleptic withdrawal.

Method

Twenty-four chronic schizophrenic patients, diagnosed according to the ICD-system, participated in the study. Leading symptoms were delusions, hallucinations, behavioral disorders, and disturbances of affect and energy level. Their age was 27 - 65 (mean ± SD 46 ± 8) years; they were treated with different neuroleptics for 1 - 24 (8 ± 7) years at a daily dosage of 560 ± 490 mg of chlorpromazine equivalents. After the first serum sampling, neuroleptic treatment was discontinued and placebo was given instead for 12 days. Blood was collected via an indwelling intravenous catheter from fasting, reclining patients in the morning 12 hours after the last neuroleptic dosage and again 12 days after drug withdrawal. The Brief Psychiatric Rating Scale (BPRS) was used to rate psychopathological syndromes on the 2 days of blood collection. Prolactin, cortisol, and β-endorphin were measured by commercially available radioimmunoassays (NEN). To increase the validity of these hormonal measurements, two individual samples 5 minutes apart were taken from each patient during neuroleptic treatment as well as after drug withdrawal. The statistical analyses were performed with the mean value of both samples.

Results

Serum levels of prolactin, β-endorphin, and cortisol during long-term neuroleptic treatment as well as after drug withdrawal are listed in Table 1. Drug withdrawal caused significant changes of all three hormones: Prolactin levels decreased (*t*-test, $df=23$; $t=3.92$, $p<0.001$), while levels of β-endorphin ($t=4.62$, $p<0.0005$), and cortisol ($t=5.19$, $p<0.0001$) both increased. Correlating serum levels during neuroleptic treatment and after withdrawal, significant relationships were found (Pearson correlation, $N=24$): prolactin $r=0.71$, $p<0.001$; β-endorphin $r=0.61$, $p<0.005$; cortisol $r=0.53$, $p<0.01$. The two serum samples, taken 5 minutes apart during neuroleptic treatment as well as after withdrawal, were also significantly correlated: prolactin $r=0.84$, $p<0.0001$ and $r=0.86$, $p<0.0001$; β-endorphin $r=0.67$, $p<0.001$ and $r=0.85$, $p<0.0001$; cortisol $r=0.67$, $p<0.001$ and $r=0.81$, $p<0.0001$. During withdrawal, β-endorphin and cortisol serum levels were significantly correlated ($r=0.63$, $p<0.001$).

Table 1

Levels of Prolactin, β-Endorphin, and Cortisol in Serum of 24 Male Chronic Schizophrenic Patients During Long-Term Neuroleptic Therapy (NL) and After Drug Withdrawal for 12 Days (WL)

Hormone	NL Mean ± SD (% of Patient Above Normal Range)	WL Mean ± SD (% of Patient Above Normal Range)
Prolactin (ng/ml)	25.2 ± 22.6 (41%)	10.6 ± 12.2 (13%)
β-Endorphin (pg/0.1 ml)	8.9 ± 1.8 (4%)	11.4 ± 3.1 (46%)
Cortisol (μg/100 ml)	17.9 ± 4.5 (8%)	23.6 ± 5.4 (42%)

Normal range: Prolactin 5-20 ng/ml; β-endorphin 5-12 pg/0.1 ml; cortisol 12-25 μg/100ml.

Drug withdrawal caused distinct changes in the psychopathology of most patients, but within the whole group the total BPRS score did not change (43.6 ± 10.9 pts vs. 42.6 ± 12.2 pts). Of the five different subscales, only "anergia" showed a significant decrease (14.5 ± 5.2 pts vs. 12.5 ± 5.8 pts; $t=3.63$, $p<0.05$). Correlating hormonal measurements with psychopathological scores, only β-endorphin serum level after neuroleptic withdrawal was significantly related to total BPRS score ($r=-0.44$, $p<0.05$) and to "angergia" ($r=-0.46$, $p<0.05$).

Relationships between serum levels of prolactin, β-endorphin, and cortisol to changes of BPRS scores after drug withdrawal are listed in Table 2. Six subjects worsened (6-16 points) and 8 subjects improved (6-12 points) by more than 6 points of the total BPRS score. These two groups did not differ in serum levels of prolactin or cortisol, but improved subjects had significantly higher levels of β-endorphin during neuroleptic treatment (10.0±2,1 pg/0.1 ml vs. 7.5±7.4 pg/0.1 ml; $t=3.15$, $p<0.02$) as well as after withdrawal (13.8±1.7 pg/0.1 ml vs. 9.8±3.5 pg/0.1 ml; $t=2.65$, $p<0.05$).

There were no significant relationships between BPRS scores or their changes after withdrawal and age, duration, or dosage of neuroleptic treatment.

Discussion

The individually very different psychopathological response to withdrawal of neuroleptics is in agreement with numerous previous studies (Andrews et al. 1976; Davis et al. 1976; Leff & Wing 1971; Prien & Klett 1972; Marder et al. 1979; Zander et al. 1981). However, looking for variables which discriminate between patients who improve and those who worsen after drug discontinuation, this study did not replicate findings that age, duration of illness, previous neuroleptic therapy (Davis et al. 1976; Marder et al. 1979; Prien & Klett 1972; Woggon 1979) or prolactin serum levels (Brown & Laughren 1981; Laughren et al. 1979; Zander et al. 1981) are valid predictors.

Only the β-endorphin serum level was found to correlate significantly with the effects on psychotic behavior: While patients with low levels mostly worsened, high levels of β-endorphin were associated with improvement or lack of change. It

Table 2

Relationships Between Hormonal Serum Levels in 24 Male Chronic Schizophrenic Patients During Neuroleptic Treatment (NL) and After 12 Days of Drug Withdrawal (WL) to Changes in BPRS Psychopathology Scores

	Changes of BPRS Psychopathology Scores (WL score-NL score, improvement = negative numbers)					
	Total Score	Anxiety Depress.	Anergia	Thought Disord.	Activat.	Hostility
Prolactin NL	−0.03	0.36	0.28	−0.25	−0.16	−0.16
Prolactin WL	−0.07	0.31	0.08	−0.15	−0.02	−0.12
β-Endorphin NL	−0.48*	−0.15	−0.54**	−0.23	0.17	−0.23
β-Endorphin WL	−0.41*	−0.23	−0.43*	0.17	−0.06	−0.45*
Cortisol NL	0.01	0.00	−0.17	0.03	0.10	0.13
Cortisol WL	−0.32	−0.32	−0.45*	0.08	0.12	0.01

Pearson correlation: * = $p<0.05$; ** $p<0.01$.

has to be considered that neuroleptic withdrawal for 12 days is a rather short period, but psychotic relapses often occur already within 8-14 days after discontinuation of long-term neuroleptic treatment (Davis et al. 1976; Zander et al. 1981). Further studies are obviously needed to investigate the possible relationship between the β-endorphin serum level and psychotic relapse following neuroleptic withdrawal.

The neuroendocrine results are similar to previous studies: Long-term neuroleptic treatment seems to induce tolerance of the tuberoinfundibular system, at least in some patients; therefore the prolactin-stimulating effect does not exist any more in all patients and the mean serum level is close to the normal range (Brown & Laughren 1981; Naber et al. 1979; Zander et al. 1981). The effect of neuroleptics on serum levels of β-endorphin in humans is controversial: Emrich et al. (1980) found a significant increase, but Brambilla et al. (1981) did not observe a significant change. Ongoing studies show that neuroleptic treatment for 2-6 weeks induces a significant increase of β-endorphin serum levels only in about 40 percent of patients (Naber et al. unpublished). The mostly normal levels found in this study could reflect the development of tolerance. The increase after neuroleptic withdrawal is probably a nonspecific stress effect, since coritsol, not affected by chronic neuroleptic therapy (Franzen 1971; Naber 1980), also increased significantly.

Psychopharmacology—A Recurring Bibliography

The bibliography below is offered to our readers to alert them to recent papers on psychopharmacology from the world literature. It was computer-generated by the Medical Literature Analysis and Retrieval System (MEDLARS) of the National Library of Medicine, National Institutes of Health, and represents papers which were entered into the system during the 3 months before the *Bulletin* went to press.

The subject headings from Index Medicus were selected by the WHO International Reference Center at the NIMH to reflect significant current interest of the international scientific community. Some nonrelevant citations may appear, and some relevant ones may be absent, but this is usual for machine-generated searches. Each subsequent issue of the *Bulletin* will provide such a bibliography, which contains two parts—a Subject Section and an Author Section.

Comments and suggestions are invited.

[Effect of the level of cholinergic processes in the body on pulmonary surfactant] Kriuchkova VI. **Fiziol Zh SSSR** 1981 Nov;67(11):1643-6 (Rus)

[Effect of central cholinergic structures on the activity of the cardiovascular system] Pastukhov VA. **Fiziol Zh SSSR** 1981 Nov; 67(11):1661-9 (Eng. Abstr.) (Rus)

[Effect of acetylcholine on gastric secretory function and its vascular tonus] Skliarov AIa. **Fiziol Zh SSSR** 1982 Jan;68(1):90-9 (Eng. Abstr.) (Rus)

ACHIEVEMENT

A four-year follow-up study of the effects of methylphenidate on the behavior and academic achievement of hyperactive children. Charles L, et al. **J Abnorm Child Psychol** 1981 Dec;9(4):495-505

AFFECT

Mood, creativity, and psychotherapeutic participation of patients receiving lithium. Phillips RH. **Psychosomatics** 1982 Jan;23(1):81-7

AFFECTIVE DISORDERS

Juggling act on a tightrope: using psychotropics in the elderly [editorial] Schell NB. **NY State J Med** 1981 Nov;81(12):1737

Biological factors in affective disorders and their relevance to lithium prophylaxis. Mendlewicz J. **Pharmacopsychiatria** 1982 Jan;15(1):11-8

Circadian rhythm mechanisms in affective illness and in antidepressant drug action. Wehr TA, et al. **Pharmacopsychiatria** 1982 Jan; 15(1):31-9 (59 ref.)

beta-Endorphin and beta-lipotropin plasma levels in chronic schizophrenia, primary affective disorders and secondary affective disorders. Brambilla F, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):321-30

[Biological perturbations in affective disorders in man] Rafaelsen OJ. **Encephale** 1981;7(4 Suppl):413-9 (Eng. Abstr.) (Fre)

AFFECTIVE DISORDERS, PSYCHOTIC

Effectiveness of verapamil in the treatment of a manic patient. Dubovsky SL, et al. **Am J Psychiatry** 1982 Apr;139(4):502-4

Carbamazepine treatment of selected affectively disordered inpatients. Folks DG, et al. **Am J Psychiatry** 1982 Jan;139(1):115-7

Lithium and glycine levels [letter] Prakash R. **Am J Psychiatry** 1982 Jan; 139(1):132

Cerebral fluoride in mania and the effect of lithium: a hypothesis. Gal EM. **Commun Psychopharmacol** 1980;4(5):405-9

[Recurrence prophylaxis of affective diseases with lithium and their results] Felber W. **Psychiatr Clin (Basel)** 1981;14(3):161-6 (Eng. Abstr.) (Ger)

[Lithium in the prophylaxis of recurrent affective disorders. Effectiveness of low plasma levels and predictors to clinical response (author's transl)] Faravelli C, et al. **Riv Patol Nerv Ment** 1980 Nov-Dec; 101(6):261-71 (Eng. Abstr.) (Ita)

AFFECTIVE SYMPTOMS

Anxiety and other neurotic symptoms in patients suffering from dans la conception des états limitrophes et des mécanismes d'action clinique des tranquillisants. Skovronsky O, et al. **Agressologie** 1981 Oct; 22(C):25-6

Prescribing of minor tranquillizers for emotional problems in a family practice. Bass MJ, et al. **Can Med Assoc J** 1981 Dec 1; 125(11):1225-6

[New trends in the concept of border states and mechanisms of clinical action of tranquilizers] Alexandrovsky YA. **Agressologie** 1981 Oct; 22(C):19-24 (Fre)

AGGRESSION

Localization of the site of the anticonflict action of benzodiazepines in the amygdaloid nucleus of rats. Shibata K, et al. **Brain Res** 1982 Feb 25;234(2):442-6

Variations in plasma and adrenal catecholamines and related enzymes in isolated-aggressive mice. Tizabi Y, et al. **Commun Psychopharmacol** 1980;4(5):433-9

Apomorphine-induced aggression in rats chronically treated with oral clonidine: modulation by central serotonergic mechanisms. Hahn RA, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):389-93 gamma-Aminobutyric acid in brain areas of isolated aggressive or non-aggressive inbred strains of mice. Simler S, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):57-61

Effect of tryptophan administration on spontaneous and P-CPA-induced muricidal aggression in laboratory rats. Valzelli L, et al. **Pharmacol Res Commun** 1981 Oct;13(9):891-7

[Biological basis of aggression] Chida AM, et al. **Rev Paul Enferm** 1981 Jul-Aug;(1):13-5 (Eng. Abstr.) **(Por)**

[Sensitization of male rats to aggressive behavior by apomorphine] Alikmets LKh, et al. **Zh Vyssh Nerv Deiat** 1982 Jan-Feb; 32(1):130-5 (Eng. Abstr.) **(Rus)**

[Role of corticosteroids in the development of fear and aggression reactions] Malyshenko NM. **Zh Vyssh Nerv Deiat** 1982 Jan-Feb; 32(1):144-51 (Eng. Abstr.) **(Rus)**

AMINO ACIDS

Lithium and amino acids [letter] Goodnick PJ, et al. **Am J Psychiatry** 1982 Apr;139(4):538-9

Protein turnover in pulmonary macrophages. Utilization of amino acids derived from protein degradation. Hammer JA 3d, et al. **Biochem J** 1981 Jul 15;198(1):53-65

On the formation of amino acids deriving from spermidine and spermine. Seiler N, et al. **Biochem J** 1981 Oct 15;200(1):123-32

Disposition of the acid-extractable amino acid pool in mammalian cells. Wheatley DN. **Cytobios** 1981;31(122):117-34

Effects of phencyclidine on excitatory amino acid activation of spinal interneurones in the cat. Lodge D, et al. **Eur J Pharmacol** 1982 Jan; 77(2-3):203-4

K+-stimulated release of endogenous glutamate, GABA and other amino acids from neuron- and glia-enriched cultures of the rat cerebellum. Pearce BR, et al. **FEBS Lett** 1981 Nov 30;135(1):215-8

Effect of antiepileptic drugs on the cerebral amino acid uptake in vitro. Saladini M, et al. **Ital J Neurol Sci** 1981 Dec;2(4):351-60

Tryptophan overload in the pregnant rat: effect on brain amino acid levels and in vitro protein synthesis. Fando JL, et al. **J Neurochem** 1981 Oct; 37(4):824-9

A regional study of 4-aminobutyrate metabolism and amino acid levels in rat brain following chronic oral administration of ethanolamine O-sulphate. Fletcher A, et al. **J Neurochem** 1982 Apr;38(4):1022-8

In vitro release of endogenous amino acids from granule cell-, stellate cell-, and climbing fiber-deficient cerebella. Flint RS, et al. **J Neurochem** 1981 Dec;37(6):1425-30

Effect of motor and premotor cortex ablation on concentrations of amino acids, monoamines, and acetylcholine and on the ultrastructure in rat striatum. A confirmation of glutamate as the specific cortico-striatal transmitter. Hassler R, et al. **J Neurochem** 1982 Apr;38(4):1087-98

Motor effects following application of putative excitatory amino acid antagonists to the region of the mesencephalic dopamine cell bodies in the rat. Dawbarn D, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(2):100-4

The effect of 6-aminonicotinamide on the levels of brain amino acids and glucose, and their labeling with 14C after injection of [U-14C] glucose. Gaitonde MK, et al. **Neurochem Res** 1981 Oct; 6(10):1159-67

AMITRIPTYLINE

Amitriptyline levels and clinical effects. Quednow B, et al. **Agressologie** 1981 Nov;22(E):15-8

Recurrence of depression after discontinuation of long-term amitriptyline treatment. Bialos D, et al. **Am J Psychiatry** 1982 Mar;139(3):325-9

Demethylation and hydroxylation of amitriptyline, nortriptyline, and 10-hydroxyamitriptyline in human liver microsomes. Mellström B, et al. **Drug Metab Dispos** 1981 Nov-Dec;9(6):565-8

Two-phase derivatization of amitriptyline and structurally related tertiary amines for gas chromatography with electron-capture detection. Karlsson KE. **J Chromatogr** 1981 Dec 18;219(3):373-8

A controlled comparison of trimipramine and amitriptyline. Kline NS. **J Clin Psychiatry** 1981 Mar;43(3):100-4

Adverse reactions to benzodiazepine-tricyclic antidepressant compound. Beresford TP, et al. **J Clin Psychopharmacol** 1981 Nov;1(6):392-4

Quantitative assessment of the pre- and postsynaptic alpha adrenoceptor antagonist potency of amitriptyline. Leighton HJ. **J Pharmacol Exp Ther** 1982 Feb;220(2):299-304

The influence of amitriptyline, imipramine and chlorpromazine on activity of arginase in rat's brain and liver. Grabowska-Hibner J, et al. **Mater Med Pol** 1981 Jan-Mar;13(1):54-7

Depression, antidepressants, and plasma DBH. Mathew RJ, et al. **Psychiatry Res** 1981 Dec;5(3):331-4

Binding of amitriptyline and nortriptyline in plasma determined from their equilibrium distributions between red cells and plasma, and between red cells and buffer solution. Burch JE, et al. **Psychopharmacology (Berlin)** 1981;75(3):262-72

[Comparison of the effectiveness of tranylcypromine, nortriptyline, thioridazine and amitriptyline in two syndromological types of endogenous depression (author's transl)] Náhunek K, et al. **Cesk Psychiatr** 1981;77(4):245-52 (Eng. Abstr.) **(Cze)**

AMOBARBITAL

[Industrial and pharmaceutical novelties. Prontalgin] **Chir Dent Fr** 1981 Nov 19;51(134):55 **(Fre)**

AMPHETAMINE

Evaluation of amphetamine-induced in vivo electrochemical response. Dayton MA, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):141-4

Stereospecific long-term effects of amphetamine on striatal dopamine neurons in rats. Steranka LR. **Eur J Pharmacol** 1981 Dec 17; 76(4):443-6

Age-related decline in brain stimulation reward: rejuvenation by amphetamine. Lewis MJ. **Exp Aging Res** 1981 Fall;7(3):225-34

Drug-induced circling after unilateral 6-hydroxydopamine lesions of the nigro-striatal pathway is mediated via the midbrain periaqueductal grey and adjacent reticular formation (angular complex). Reavill C, et al. **Life Sci** 1981 Dec 7;29(23):2357-65

Amphetamine psychosis and schizophrenia: a dual model. Kokkinidis L, et al. **Neurosci Biobehav Rev** 1981 Winter;5(4):449-61 (173 ref.)

Ontogeny of fenfluramine and amphetamine anorexia compared in rat pups. Leshem M. **Pharmacol Biochem Behav** 1981 Dec;15(6):859-63

Differential effects of l-amphetamine on ontogeny of active avoidance, intertrial responses, and locomotor activity. Bauer R, et al. **Psychopharmacology (Berlin)** 1981;75(3):299-304

A comparison of some behavioural effects of amphetamine and electrical brain stimulation of the mesolimbic dopamine system in rats. D'Mello GD. **Psychopharmacology (Berlin)** 1981;75(2):184-92

Amphetamine-associated myoglobinuric renal failure. Scandling J, et al. **South Med J** 1982 Feb;75(2):237-40

[Effect of phenamine and haloperidol on stereotyped behavior in response to electric stimulation of the substantia nigra in cats] Arushanian EB, et al. **Biull Eksp Biol Med** 1981 Oct;91(10):444-7 (Eng. Abstr.) **(Rus)**

[Effect of high doses of phenamine on instrumental defensive reflexes in intact and striatectomized rats] Baturin VA. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec;31(6):1305-7 **(Rus)**

[Effect of N-(4-picolyl)-3,5 dimethylbenzamide (M-14012-4) on stereotyped behavior induced by apomorphine and amphetamine in the rat and mouse] Casais PL, et al. **Arch Farmacol Toxicol** 1981 Apr; 7(1):65-72 **(Spa)**

[Peripheral mechanisms implicated in the interaction of atropine, amphetamine and reserpine on body temperature in the conscious rat] Milanés MV, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):77-8 **(Spa)**

AMPHETAMINES

Stereochemical aspects of para-chloroamphetamine metabolism. Rabbit liver microsomal metabolism of RS-, R(-)-, and S(para-chloroamphetamine. Ames MM, et al. **Biochem Pharmacol** 1982 Jan 1;31(1):5-9

Conversion of N-hydroxyamphetamine to phenylacetone oxime by rat liver microsomes. Matsumoto RM, et al. **Biochem Pharmacol** 1982 Jan 1;31(1):105-8

The effects of 2,5-dimethoxy-4-methylamphetamine (DOM) on operant behavior: interactions with other neuroactive agents. Commissaris RL, et al. **Commun Psychopharmacol** 1980;4(5):393-404

Neurochemical and behavioural correlates of the interaction between amphetamine and delta 9-tetrahydrocannabinol in the rat. Lew EO, et al. **Drug Alcohol Depend** 1981 Sep;8(2):93-101

p-Chloroamphetamine: effects on tonic immobility, activity, and temperature in chickens. Boren JL, et al. **J Comp Physiol Psychol** 1981 Dec;95(6):991-1002

ANOREXIA NERVOSA

A double-blind controlled trial of lithium carbonate primary anorexia nervosa. Gross HA, et al. **J Clin Psychopharmacol** 1981 Nov; 1(6):376-81

[Therapy of anorexia nervosa aimed at depressive manifestations] Kadlecová B. **Cesk Pediatr** 1981 Nov;36(11):666-7 **(Cze)**

ANTIDEPRESSIVE AGENTS

Comparison of the dosage schedules during the administration of retarded lithium carbonate. Balon R, et al. **Act Nerv Super (Praha)** 1981; 23(4):278-80

Treatment of enuresis with sydnocarb. Polák L, et al. **Act Nerv Super (Praha)** 1981;23(4):263-4

Duration of REM sleep latency as predictor of effect of antidepressant therapy. A preliminary report. Svendsen K, et al. **Acta Psychiatr Scand** 1981 Sep;64(3):238-43

Relationship between plasma antidepressant levels and clinical outcome for inpatients receiving imipramine. Simpson GM, et al. **Am J Psychiatry** 1982 Mar;139(3):358-60

The efficacy of cognitive therapy in depression: a treatment trial using cognitive therapy and pharmacotherapy, each alone and in combination.

Blackburn IM, et al. **Br J Psychiatry** 1981 Sep;139:181-9

Zimelidine and norzimelidine protein binding measured by equilibrium dialysis and cerebrospinal fluid. Calil HM, et al. **Clin Pharmacol Ther** 1982 Apr;31(4):522-7

The new generation of antidepressants. Davis JM, et al. **Curr Psychiatr Ther** 1981;20:293-7

Brain histamine H1- and H2-receptors and histamine-sensitive adenylate cyclase: effects of antipsychotics and antidepressants. Coupet J, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):149-55

alpha 1-Adrenoceptor-mediated responses in the lateral geniculate nucleus are enhanced by chronic antidepressant treatment. Menkes DB, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):27-35

Effect of norepinephrine uptake blocker on beta-adrenergic receptors of the rat cerebral cortex. Sethy VH, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):53-6

Poor prophylactic lithium response due to antidepressants. Reginaldi D, et al. **Int Pharmacopsychiatry** 1981;16(2):124-8

Rapid cyclers and antidepressants. Tondo L, et al. **Int Pharmacopsychiatry** 1981;16(2):119-23

Changes in saliva secretion and accommodation width during short-term administration of imipramine and zimelidine in healthy volunteers. von Knorring L. **Int Pharmacopsychiatry** 1981;16(2):69-78

Determination of the antidepressant agent citalopram and metabolites in plasma by liquid chromatography with fluorescence detection. Oyehaug E, et al. **J Chromatogr** 1982 Jan 8;227(1):129-35

Gas chromatographic determination of noxyptyline in substance, tablets and in biological material. Szyszko E, et al. **J Chromatogr** 1981 Dec 4;219(2):291-6

Methodological problems in studies of depressive disorder: utility of the discontinuation design. Quitkin FM, et al. **J Clin Psychopharmacol** 1981 Sep;1(5):283-8

How capable of driving are hospitalized psychiatric patients under psycho-active drug therapy? Hobi V, et al. **J Int Med Res** 1981; 9(6):434-47

Pyrazolodiazepines. 3. 4-Aryl-1,6,7,8-tetrahydro-1,3-dialkylpyrazolo[3,4-e][1,4]diazepines as antidepressant agents. DeWald HA, et al. **J Med Chem** 1981 Aug; 24(8):982-7

A new nontricyclic antidepressant agent. Synthesis and activity of N-[trans-2-(dimethylamino)cyclopentyl]-N-(3,4-dichlorophenyl)propa and related compounds. Szmuszkovicz J, et al. **J Med Chem** 1981 Oct; 24(10):1230-6

Active conformation of polycyclic antidepressants. Asscher Y, et al. **J Pharm Sci** 1982 Jan;71(1):122-4

Comments on multicenter trials of antidepressant drugs. Hippius H, et al. **Mod Probl Pharmacopsychiatry** 1981;16:95-9

The effects of antidepressant drugs on conditioned taste aversion learning of the olfactory bulbectomized rat. Jancsár SM, et al. **Neuropharmacology** 1981 Dec;20(12B):1341-5

Neuroleptics as antidepressants. Robertson MM, et al. **Neuropharmacology** 1981 Dec;20(12B):1335-6

Effect of antidepressant drugs on carbachol chloride-induced wet dog shake behaviour in rats. Turski L, et al. **Neuropharmacology** 1981 Dec; 20(12A):1193-6

Atypical antidepressant drugs - psychopharmacological profile and mechanism of action. Maj J. **Pharmacopsychiatria** 1982 Jan; 15(1):26-30

Circadian rhythm mechanisms in affective illness and in antidepressant drug action. Wehr TA, et al. **Pharmacopsychiatria** 1982 Jan; 15(1):31-9 (59 ref.)

Effects of cholinomimetics, cholinolytics and atypical antidepressants in the behavioral despair test in the rat. Herman ZS, et al. **Pol J Pharmacol Pharm** 1981;33(5):485-9

The effect of pyrazidol on the central serotonergic system. Sypniewska M, et al. **Pol J Pharmacol Pharm** 1981;33(3):313-9

Advances in antidepressant treatment? Jenner FA. **Practitioner** 1981 Oct; 225(1360):1378-85

Non-tricyclic antidepressants. van Dijk J, et al. **Prog Med Chem** 1978; 15:261-320 (351 ref.)

The biotransformation of [14C]minaprine in man and five animals species. Davi H, et al. **Xenobiotica** 1981 Nov;11(11):735-47

[Therapy of anorexia nervosa aimed at depressive manifestations] Kadlecová B. **Cesk Pediatr** 1981 Nov;36(11):666-7 (Cze)

[Drug therapy of anxiety states] Laux G. **Krankenpfl J** 1982 Feb 15; 20(2):22-4 (Ger)

ANXIETY DISORDERS

Pimozide versus chlordiazepoxide in anxiety neurosis. Doongaji DR, et al. **Acta Psychiatr Belg** 1981 Jul-Aug;81(4):416-23

Anxiolytic properties of neuroleptic drugs. Balon R, et al. **Agressologie** 1981 Nov;22(D):9-10

Neuroleptics in neurotic anxiety. Boleloucky Z. **Agressologie** 1981 Nov; 22(D):15-7

Dothiepin, antianxiety effect in neurotic women. Boriová M, et al. **Agressologie** 1981 Nov;22(E):9-10

A double-blind, placebo-controlled study with tofizopam in anxiety neurosis. Filip V, et al. **Agressologie** 1981 Oct;22(C):27-30

Clinical trial with clobazam. Kabes J, et al. **Agressologie** 1981 Oct; 22(C):41-2

Treatment of anxious depression with intravenous infusions of a combination of drugs. Krebs-Roubicek L, et al. **Agressologie** 1981 Nov; 22(D):25-6

Tofizopam in the therapy of anxious-depressive syndromes. Molcan J, et al. **Agressologie** 1981 Nov;22(D):23-4

Influence of different psychotropic drugs on psychotic anxiety. Nahunek

K. et al. **Agressologie** 1981 Nov;22(D):11-3

Neuroleptics in the treatment of anxiety. Schmidt P. **Agressologie** 1981 Nov;22(D):19-20

Differentiated psychopharmacotherapy in anxiety states of slowly progressive schizophrenia. Smulevitch A. **Agressologie** 1981 Nov;22(D):31-2

Anxiety in climax and its pharmacological treatment. Tendlova H, et al. **Agressologie** 1981 Nov;22(E):7-8

Drug treatment of anxiety. Vinar O. **Agressologie** 1981 Oct;22(C):35-8

Case report of painful ejaculation as a side effect of amoxapine. Kulik FA, et al. **Am J Psychiatry** 1982 Feb;139(2):234-5

Major common symptoms in psychiatry. Anxiety. Tyrer P. **Br J Hosp Med** 1982 Feb;27(2):109-13

Diazepam, propranolol and their combination in the management of chronic anxiety. Hallstrom C, et al. **Br J Psychiatry** 1981 Nov;139:417-21

Recent advances in anxiolytic therapy. Rickels K. **J Clin Psychiatry** 1981 Nov;42(11 Pt 2):40-4

Current therapeutic options in the management of typical anxiety. Schuckit MA. **J Clin Psychiatry** 1981 Nov;42(11 Pt 2):15-26

Specific anxiety syndromes: current therapeutic options. Uhlenhuth EH. **J Clin Psychiatry** 1981 Nov;42(11 Pt 2):27-34

Catecholamine and dopamine-beta-hydroxylase in anxiety. Mathew RJ, et al. **J Psychosom Res** 1981;25(6):499-504

[Personality, antidepressant and neuroses] Bolelouckỳ Z, et al. **Agressologie** 1981 Nov;22(E):3-5 **(Fre)**

[Psychopathology of anxiety] Guensberger E, et al. **Agressologie** 1981 Oct;22(C):31-3 (Eng. Abstr.) **(Fre)**

[Comparative results of the treatment of anxiety in the depressive syndrome with Tolvon, Vivalan and Alival] Ivanov V, et al. **Agressologie** 1981 Nov;22(D):29-30 **(Fre)**

[Interactions between depression and anxiety (author's transl)] Ballus C. **Encephale** 1981;7(4 Suppl):335-7 (Eng. Abstr.) **(Fre)**

[Comparative studies on the tranquilizer effect of fluspirilene and bromazepam] Thilmann J. **Med Welt** 1981 Dec 25;32(51-52):1959-61 **(Ger)**

APOMORPHINE

Androgenic influences on apomorphine-induced yawning in rats. Berendsen HH, et al. **Behav Neural Biol** 1981 Sep;33(1):123-8

Inhibition by apomorphine of the potassium-evoked release of [3H]-gamma-aminobutyric acid from the rat substantia nigra in vitro. Arbilla S, et al. **Br J Pharmacol** 1981 Oct;74(2):389-97

N-n-propyl-norapomorphine: an extremely potent stimulant of dopamine autoreceptors. Argiolas A, et al. **Brain Res** 1982 Jan 7;231(1):109-16

An orally effective, long-acting dopaminergic prodrug: (-)-10,11-methylenedioxy-N-propylnoraporphine. Baldessarini RJ, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):87-8

Pharmacological profiles of the putative dopamine autoreceptor agonists 3-PPP and TL-99. Martin GE, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):15-23

Alterations in local cerebral glucose utilisation in specific thalamic nuclei following apomorphine. McCulloch J, et al. **J Cereb Blood Flow Metab** 1981;1(1):133-6

Apomorphine-induced aggression in rats chronically treated with oral clonidine: modulation by central serotonergic mechanisms. Hahn RA, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):389-93

Interaction of apomorphine and stressors in the production of hyperthermia in the rabbit. Snow AE, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):335-9

Drug-induced circling after unilateral 6-hydroxydopamine lesions of the nigro-striatal pathway is mediated via the midbrain periaqueductal grey and adjacent reticular formation (angular complex). Reavill C, et al. **Life Sci** 1981 Dec 7;29(23):2357-65

The use of dopamine agonists in the treatment of schizophrenia. Corsini GU, et al. **Neuropharmacology** 1981 Dec;20(12B):1309-13

Behavioural and neurochemical studies on apomorphine-induced hypomotility in mice. Sumners C, et al. **Neuropharmacology** 1981 Dec;20(12A):1203-8

Dopaminergic agonistic and antagonistic drugs in the ventral tegmentum of rats inhibit and facilitate changes of food-search behaviour. Oades RD. **Neurosci Lett** 1981 Nov 18;27(1):75-80

The effects of quipazine, fenfluramine and apomorphine on the morphine potentiation of tonic immobility. Wallnau LB. **Pharmacol Biochem Behav** 1981 Dec;15(6):895-901

Substance P levels in the rat forebrain after apomorphine and haloperidol treatment. Janicki P, et al. **Pol J Pharmacol Pharm** 1981;33(5):499-502

Haloperidol and clonidine increase, and apomorphine decreases ultrasonic vocalizations by gerbils. Thiessen DD, et al. **Psychopharmacology (Berlin)** 1981;75(3):287-90

[Effects of different doses of apomorphine on the glutamate decarboxylase activity of the substantia nigra and the medial basal hypothalamus] Giammona G, et al. **Boll Soc Ital Biol Sper** 1981 Oct 30;57(20):2074-9 (Eng. Abstr.) **(Ita)**

[Effect of amizil and galantamin on the behavioral effects of apomorphine in rats] Bandman AL, et al. **Biull Eksp Biol Med** 1981 Nov;92(11):566-9 (Eng. Abstr.) **(Rus)**

[Sensitization of male rats to aggressive behavior by apomorphine] Allikmets LKh, et al. **Zh Vyssh Nerv Deiat** 1982 Jan-Feb;32(1):130-5 (Eng. Abstr.) **(Rus)**

[Effect of N-(4-picolyl)-3,5 dimethylbenzamide (M-14012-4) on stereotyped behavior induced by apomorphine and amphetamine in the rat and mouse] Casais PL, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):65-72 **(Spa)**

APPETITE

A neurochemical theory of appetite and weight changes in depressive states. Hopkinson G. **Acta Psychiatr Scand** 1981 Sep;64(3):217-25

ATTENTION

Methylphenidate compared with behavioral self-control in attention deficit disorder: preliminary report. Anderson EE, et al. **JDBP** 1981 Dec;2(4):137-41

Effects of levodopa on attention deficit disorder, residual type. Wood D, et al. **Psychiatry Res** 1982 Feb;6(1):13-20

AVOIDANCE LEARNING

Piribedil-induced anti-hypoxic protection in rats. Saligaut C, et al. **Aviat Space Environ Med** 1982 Jan;53(1):35-9

Lesions of the olfactory pathways affecting neophobia and learned aversion differentially. Royet JP, et al. **Behav Brain Res** 1982 Mar;4(3):251-62

Effects of metenkephalin on the formation and fixation of defensive temporal associations and on the incorporation of C14-leucine in brain proteins of the rat. Kruglikov RI, et al. **Biol Bull Acad Sci USSR** 1980 Sep-Oct;7(5):432-4

Behavioral effects and physiological disposition of some beta-hydroxylated indoleamines in the rat. Gentile NT, et al. **Biol Psychiatry** 1982 Jan;17(1):109-13

Selective associations in one-day-old rats: taste-toxicosis and texture-shock aversion learning. Gemberling GA, et al. **J Comp Physiol Psychol** 1982 Feb;96(1):105-13

Acetylcholine metabolism in the rat hippocampus and striatum following one-trial passive training. Barker LA, et al. **Neuropharmacology** 1982 Feb;21(2):183-5

A circadian rhythm in passive avoidance behavior: the effect of phase shift and the benzodiazepines. Childs G, et al. **Neuropharmacology** 1981 Dec;20(12B):1365-6

The effects of antidepressant drugs on conditioned taste aversion learning of the olfactory bulbectomized rat. Jancsár SM, et al. **Neuropharmacology** 1981 Dec;20(12B):1341-5

Correlation between retention of defensive conditioned reflexes and brain acetylcholinesterase activity in rats. Dish TN. **Neurosci Behav Physiol** 1981 May-Jun;11(3):230-3

Correlation between the rate of avoidance conditioning and the brain catecholamine level in rats. Saul'skaya NB. **Neurosci Behav Physiol** 1981 May-Jun;11(3):221-6

On the interactive role of central noradrenaline neurons and corticosterone in two-way active avoidance acquisition in the rat. Archer T, et al. **Neurosci Lett** 1981 Dec 23;27(3):341-6

Effects of bilateral amygdala lesions on neophobia and conditioned taste aversion in mice. Shimai S, et al. **Percept Mot Skills** 1982 Feb;54(1):127-30

Kyotorphins affect aversive pecking in chicks. Kastin AJ, et al. **Physiol Behav** 1981 Dec;27(6):1073-6

Behavioral and corticosterone effects in conditioned taste aversion following hippocampal lesions. Smotherman WP, et al. **Physiol Behav** 1981 Oct;27(4):569-74

Learned aversions in rats fed a tryptophan-free diet. Treneer CM, et al. **Physiol Behav** 1981 Nov;27(5):757-60

Differential effects of l-amphetamine on ontogeny of active avoidance, intertrial responses, and locomotor activity. Bauer R, et al. **Psychopharmacology (Berlin)** 1981;75(3):299-304

Enhancement of the avoidance-suppressing effects of neuroleptic agents after repeated administration: changes in the discriminated avoidance response in rats. Kuribara H, et al. **Psychopharmacology (Berlin)** 1981;75(2):148-51

Differential reversal of various dopamine antagonists by anticholinergics in Sidman avoidance: possible relationship to adrenergic blockade. Liebman JM, et al. **Psychopharmacology (Berlin)** 1981;75(3):248-53

[Dualistic action of scopolamine on avoidance conditioned response in dogs (author's transl)] Niu XY, et al. **Chung Kuo Yao Li Hsueh Pao** 1981 Mar;2(1):4-8 (Eng. Abstr.) **(Chi)**

[Learning in rats with differing emotional responsiveness and its relation to brain monoamines] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec;31(6):1238-46 (Eng. Abstr.) **(Rus)**

AZEPINES

Comparison of the in vitro metabolism of N-nitrosohexamethyleneimine by rat liver and lung microsomal fractions. Hecker LI, et al. **Cancer Res** 1982 Jan;42(1):59-64

alpha 2-Adrenoceptor agonistic effect of B-HT 920 in isolated perfused hindquarters of rats. Kobinger W, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):101-5

Effect of cetiedil on cation and water movements in erythrocytes. Schmidt WF 3d, et al. **J Clin Invest** 1982 Mar;69(3):589-94

Pyrazolodiazepines. 3. 4-Aryl-1,6,7,8-tetrahydro-1,3-dialkylpyrazolo[3,4-e][1,4]diazepines as antidepressant agents. DeWald HA, et al. **J Med Chem** 1981 Aug; 24(8):982-7

[Effectiveness of the repellent action and the prospects for using clothing chemically bonded with carboxide] Dremova VP, et al. **Med Parazitol (Mosk)** 1982 Jan-Feb;51(1):39-44 (Eng. Abstr.) **(Rus)**

BEHAVIOR

Neurochemistry of behaviour. Warburton DM. **Br Med Bull** 1981 May; 37(2):121-5 (45 ref.)

A four-year follow-up study of the effects of methylphenidate on the behavior and academic achievement of hyperactive children. Charles L, et al. **J Abnorm Child Psychol** 1981 Dec;9(4):495-505

An analysis of commonalities in substance abuse and habitual behavior. Levison PK. **Natl Inst Drug Abuse Res Monogr Ser** 1981 Jul; (37):27-41

Quantitative EEG and behavioral effects in volunteers of a new benzodiazepine (SAS 643) in relation to drug plasma concentration. Sannita WG, et al. **Ther Drug Monit** 1981;3(4):341-9

BEHAVIOR, ANIMAL

Some behavioral effects of antiepileptic drugs during acute and prolonged treatment in the rat. Kulig BM. **Acta Neurol Scand [Suppl]** 1981; 89:59-67

Central neurotropic activity of homovanillic acid. Kleinrok Z, et al. **Acta Physiol Pol** 1981 Sep-Oct;32(5):477-85

Taurine and thermoregulation: behavioral and cellular studies. Carlà V, et al. **Adv Exp Med Biol** 1981;139:361-72

Endorphins and behavior. Bolles RC, et al. **Annu Rev Psychol** 1982; 33:87-101

Circling behavior produced by unilateral lesions of the central vestibular system. Shima F, et al. **Appl Neurophysiol** 1982 May-Jun; 45(3):255-60

Androgenic influences on apomorphine-induced yawning in rats. Berendsen HH, et al. **Behav Neural Biol** 1981 Sep;33(1):123-8

The effect of PEA on serotonin and catecholamines. Widelitz MM, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):1107-11

Amygdalar noradrenergic and dopaminergic mechanisms in the regulation of hunger and thirst-motivated behavior. Lénárd L, et al. **Brain Res** 1982 Feb 4;233(1):115-32

Neurochemical and behavioural correlates of the interaction between amphetamine and delta 9-tetrahydrocannabinol in the rat. Lew EO, et al. **Drug Alcohol Depend** 1981 Sep;8(2):93-101

The effect of some anti-epilepsy drugs on enhancement of the monoamine-mediated behavioural responses following the administration of electroconvulsive shocks to rats. Bhavsar VH, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):243-7

Suppressive action of cholecystokinin octapeptide on the behavioral effects of L-DOPA in the rat. Itoh S, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):313-6

Lithium dissociates haloperidol-induced behavioral supersensitivity from reduced dopac increase in rat striatum. Meller E, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):25-9

An improved pharmacological procedure for depletion of noradrenaline: pharmacology and assessment of noradrenaline-associated behaviors. Zolovick AJ, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):265-71

3H-Diazepam binding sites in Roman high- and low-avoidance rats. Gentsch C, et al. **Experientia** 1981 Dec 15;37(12):1315-6

Unlimited access intravenous drug self-administration in rhesus monkeys. Balster RL, et al. **Fed Proc** 1982 Feb;41(2):211-5

Time-dependent environmentally-induced changes in cerebral and extra-cerebral morphology and chemistry--the basis of learning, memory and behavior. DeFeudis FV. **Gen Pharmacol** 1982;13(1):1-9 (97 ref.)

Comparative effects of short- and long-term treatment with neuroleptics on behavioural activity as well as dopamine turnover in striatum. Rastogi RB, et al. **Gen Pharmacol** 1982;13(1):35-40

A reliable multichannel commutator for making electrical contact with conscious, freely moving rats. Andrews CD, et al. **J Neurosci Methods** 1982 Jan;5(1-2):73-6

Stereospecificity of behavioural effects of viloxazine in bulbectomized rats does not correlate with its 5-HT-releasing action in vitro. Greenwood DT, et al. **J Pharm Pharmacol** 1982 Jan;34(1):38-41

Sodium valproate exerts anti-conflict activity in rats without any concomitant rise in forebrain GABA level. Rasmussen KJ, et al. **Life Sci** 1981 Nov 23;29(21):2163-70

Drug-induced circling after unilateral 6-hydroxydopamine lesions of the nigro-striatal pathway is mediated via the midbrain periaqueductal grey and adjacent reticular formation (angular complex). Reavill C, et al. **Life Sci** 1981 Dec 7;29(23):2357-65

The behavioural effects of systemically administered kainic acid: a pharmacological analysis. Worms P, et al. **Life Sci** 1981 Nov 23; 29(21):2215-25

Differential drug effects as a function of the controlling consequences. Barrett JE. **Natl Inst Drug Abuse Res Monogr Ser** 1981 Jul; (37):159-81 (40 ref.)

Differential involvement of dopamine-containing tracts in 5-hydroxytryptamine-dependent behaviours caused by amphetamine in large doses. Andrews CD, et al. **Neuropharmacology** 1982 Jan; 21(1):63-8

Repeated administration of triiodothyronine (T3) to rats enhances nigrostriatal and mesolimbic dopaminergic behavioural responses. Heal DJ, et al. **Neuropharmacology** 1982 Feb;21(2):159-62

Pharmacological properties of new antipsychotic agents: use of animal models. Puech AJ, et al. **Neuropharmacology** 1981 Dec; 20(12B):1279-84

Effect of antidepressant drugs on carbachol chloride-induced wet dog shake behaviour in rats. Turski L, et al. **Neuropharmacology** 1981 Dec; 20(12A):1193-6

Behavioral and temperature changes induced by clonidine in the developing rat. Reinstein DK, et al. **Neurosci Lett** 1981 Nov 4; 26(3):251-7

Computer-aided calculation of dose response curves in behavioral pharmacology by using a nonlinear regression procedure. Morgenstern R, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):987-91

Rats' responses to blood and body odors of stressed and non-stressed conspecifics. Mackay-Sim A, et al. **Physiol Behav** 1981 Sep; 27(3):503-10

Behavioral and corticosterone effects in conditioned taste aversion following hippocampal lesions. Smotherman WP, et al. **Physiol Behav** 1981 Oct;27(4):569-74

Studies on the behavioral and hypotensive effects of intraventricular prostacyclin (PGI2) in rats. Brus K, et al. **Pol J Pharmacol Pharm** 1981; 33(4):467-74

Effects of cholinomimetics, cholinolytics and atypical antidepressants in the behavioral despair test in the rat. Herman ZS, et al. **Pol J Pharmacol Pharm** 1981;33(5):485-9

Psychopharmacological effects of cholinomimetic agents administered into hippocampus and various hypothalamic areas in the rat. Thesis. Plech A. **Pol J Pharmacol Pharm** 1981;33(4):415-20

Effect of parachlorophenylalanine on the incidence of abnormal behavior observed following diazepam withdrawal. Suzuki T, et al. **Prog Neuropsychopharmacol** 1981;5(4):415-7

Differential inhibitory effects of ascorbic acid on the binding of dopamine agonists and antagonists to neostriatal membrane preparations: correlations with behavioral effects. Heikkila RE, et al. **Res Commun Chem Pathol Pharmacol** 1981 Dec;34(3):409-21

Effect of prenatal phenytoin administration on postnatal development of the rat: a behavioral teratology study. Elmazar MM, et al. **Teratology** 1981 Oct;24(2):115-24

BENACTYZINE

[Effect of amizil and galantamin on the behavioral effects of apomorphine in rats] Bandman AL, et al. **Biull Eksp Biol Med** 1981 Nov; 92(11):566-9 (Eng. Abstr.) **(Rus)**

BENZAZEPINES

Selective action of diltiazem on cerebral vascular smooth muscle in the rabbit: antagonism of extrinsic but not intrinsic maintained tone. Bevan JA. **Am J Cardiol** 1982 Feb 18;49(3):519-24

Comparative electrophysiologic and coronary hemodynamic effects of diltiazem, nisoldipine and verapamil on myocardial tissue. Lathrop DA, et al. **Am J Cardiol** 1982 Feb 18;49(3):613-20

Effect of diltiazem on calcium transport and development of tension in heart muscle. Morad M, et al. **Am J Cardiol** 1982 Feb 18; 49(3):595-601

Electrophysiologic effects of diltiazem in canine myocardium, with special reference to conduction delay during ischemia. Peter T, et al. **Am J Cardiol** 1982 Feb 18;49(3):602-5

Pharmacokinetics of diltiazem in selected animal species and human beings. Piepho RW, et al. **Am J Cardiol** 1982 Feb 18;49(3):525-8

The pharmacokinetics of diltiazem in healthy American men. Zelis RF, et al. **Am J Cardiol** 1982 Feb 18;49(3):529-32

Effects of diltiazem on smooth muscles and neuromuscular junction in the mesenteric artery. Suzuki H, et al. **Am J Physiol** 1982 Mar; 242(3):H325-36

Cold blood-diltiazem cardioplegia. Barner HB, et al. **Ann Thorac Surg** 1982 Jan;33(1):55-63

[Effects of diltiazem on catecholamine release from cat adrenal glands (author's transl)] Yamaguchi I, et al. **Nippon Yakurigaku Zasshi** 1981 Nov;78(5):501-9 (Eng. Abstr.) (Jpn)

BENZODIAZEPINE TRANQUILIZERS

The passage of flunitrazepam into cerebrospinal fluid in man. Aaltonen L, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Apr;48(4):364-8

Neuroleptics in neurotic anxiety. Boleloucky Z. **Agressologie** 1981 Nov;22(D):15-7

A double-blind, placebo-controlled study with tofizopam in anxiety neurosis. Filip V, et al. **Agressologie** 1981 Oct;22(C):27-30

Clinical trial with clobazam. Kabes J, et al. **Agressologie** 1981 Oct;22(C):41-2

Subjective and psychometric assessment of effect in single application of clobazam. Molcan J, et al. **Agressologie** 1981 Oct;22(C):43-5

Tofizopam in the therapy of anxious-depressive syndromes. Molcan J, et al. **Agressologie** 1981 Nov;22(D):23-4

Differentiated psychopharmacotherapy in anxiety states of slowly progressive schizophrenia. Smulevitch A. **Agressologie** 1981 Nov;22(D):31-2

Clinical investigations of some anxiolytics drugs. Welbel SL. **Agressologie** 1981 Oct;22(C):39-40

Cimetidine--benzodiazepine interactions [letter] Mangini RJ. **Am J Hosp Pharm** 1982 Feb;39(2):236, 242

Lorazepam and desipramine serum concentration [letter] Rosenblatt JE. **Am J Psychiatry** 1982 Apr;139(4):536-7

Lorazepam and oxazepam esters. Hydrophobicity, hydrolysis rates and brain appearance. Simon-Trompler E, et al. **Arzneimittelforsch** 1982;32(2):102-5

Sedation for upper gastrointestinal endoscopy [letter] Bardhan KD. **Br J Anaesth** 1981 Dec;53(12):1368

Clobazam kinetics in the elderly. Greenblatt DJ, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):631-6

Hypnotic activity and effects on performance of lormetazepam and camazepam--analogues of temazepam. Nicholson AN, et al. **Br J Clin Pharmacol** 1982 Mar;13(3):433-9

Impaired elimination of lorazepam following subchronic administration in two patients with renal failure [letter] Verbeeck RK, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):749-51

Urinary monoamine oxidase inhibitor and benzodiazepine withdrawal. Petursson H, et al. **Br J Psychiatry** 1982 Jan;140:7-10

Localization of the site of the anticonflict action of benzodiazepines in the amygdaloid nucleus of rats. Shibata K, et al. **Brain Res** 1982 Feb 25;234(2):442-6

Steady-state plasma desmethyldiazepam during long-term clorazepate use: effects of antacids. Shader RI, et al. **Clin Pharmacol Ther** 1982 Feb;31(2):180-3

Lormetazepam - yet another benzodiazepine. **Drug Ther Bull** 1982 Jan 8;20(1):3-4

Pharmacokinetics of N-desmethyldiazepam after a single oral dose of clorazepate: the effect of smoking. Norman TR, et al. **Br J Clin Pharmacol** 1981;21(3):229-33

The kinetics and displacement of [11C]flunitrazepam in the brain of the living baboon. Comar D, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):21-6

Benzodiazepines suppress the light response of retinal dopaminergic neurons in vivo. Kamp CW, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):343-6

Absorption, distribution, elimination and metabolism of tofizopam, a new 2,3-benzodiazepine derivative, in animal experiments. Elekes I, et al. **Farmaco [Prat]** 1981 Dec;36(12):542-52

Quantitative determination of camazepam and its metabolite temazepam in man by gas-liquid chromatography with electron-capture detection. Riva R, et al. **Farmaco [Prat]** 1982 Jan;37(1):15-9

Analysis of the metabolites of ethyl loflazepate by gas chromatography with electron-capture detection. Cano JP, et al. **J Chromatogr** 1981 Dec 11;226(2):413-22

Assay of flunitrazepam, temazepam and desalkylflurazepam in plasma by capillary gas chromatography with electron-capture detection. Jochemsen R, et al. **J Chromatogr** 1982 Jan 8;227(1):199-206

High-performance liquid chromatographic determination of lorazepam in monkey plasma. Walmsley LM, et al. **J Chromatogr** 1981 Nov 13;226(1):155-63

Recent advances in anxiolytic therapy. Rickels K. **J Clin Psychiatry** 1981 Nov;42(11 Pt 2):40-4

Pharmacokinetic comparison of sublingual lorazepam with intravenous, intramuscular, and oral lorazepam. Greenblatt DJ, et al. **J Pharm Sci** 1982 Feb;71(2):248-52

Benzodiazepine inhibition of site-specific binding of nitrobenzylthioinosine, an inhibitor of adenosine transport. Hammond JR, et al. **Life Sci** 1981 Nov 23;29(21):2207-14

Anxiolytic properties of opiates and endogenous opioid peptides and their relationship to the actions of benzodiazepines. Millan MJ, et al. **Mod Probl Pharmacopsychiatry** 1981;17:123-41

The drug treatment of anxiety. Rosenbaum JF. **N Engl J Med** 1982 Feb 18;306(7):401-4 (24 ref.)

Benzodiazepines: clinical use patterns. Rickels K. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(33):43-60

A circadian rhythm in passive avoidance behavior: the effect of phase shift and the benzodiazepines. Childs G, et al. **Neuropharmacology** 1981 Dec;20(12B):1365-6

Effect of benzodiazepines on cyclic GMP formation in rat cerebellar slices. Smith CC, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):29-33

Self-injection of barbiturates and benzodiazepines in baboons. Griffiths RR, et al. **Psychopharmacology (Berlin)** 1981;75(2):101-9

Effect of age and sex on disposition of desmethyldiazepam formed from its precursor clorazepate. Shader RI, et al. **Psychopharmacology (Berlin)** 1981;75(2):193-7

GLC-ECD determination of 1-(2-hydroxyethyl)-3-hydroxy-7-chloro-1,3-dihydro-5-(O-fluorophe (SAS 643) in plasma and urine and identification of its main biotransformation products. Mardente S, et al. **Ther Drug Monit** 1981;3(4):351-6

Quantitative EEG and behavioral effects in volunteers of a new benzodiazepine (SAS 643) in relation to drug plasma concentration. Sannita WG, et al. **Ther Drug Monit** 1981;3(4):341-9

[Lorazepam. Evaluation after extensive use] Fouks L. **Agressologie** 1981 Oct;22(C):51-3 (Fre)

[Comparative study of the hypnogenic effect of bromazepam and flunitrazepam] Porot M, et al. **Ann Med Psychol (Paris)** 1981;139(8):919-23 (Fre)

[Relation between the clinical effect and the pharmacokinetics of midazolam following i.m. and i.v. administration/2nd comm.: Pharmacokinetical aspects (author's transl)] Crevoisier C, et al. **Arzneimittelforsch** 1981;31(12a):2211-5 (Eng. Abstr.) (Fre)

[Relationship between clinical effects and pharmacokinetics of midazolam on i.m. and i.v. application to volunteers/1st comm.: Clinical aspects (author's transl)] Ziegler WH, et al. **Arzneimittelforsch** 1981;31(12a):2206-10 (Eng. Abstr.) (Fre)

[Benzodiazepines as psycholeptica (author's transl)] Bouffioux R, et al. **Rev Med Brux** 1982 Jan;3(1):55-61 (Eng. Abstr.) (Fre)

[The antagonistic effect of physostigmine on sedation by lormetazepam (author's transl) Grote B, et al. **Anaesthesist** 1981 Dec;30(12):627-32 (Eng. Abstr.) (Ger)

[Intramuscular application of midazolam. Its effect upon CNS and respiration (author's transl)] Grote B, et al. **Arzneimittelforsch** 1981;31(12a):2224-5 (Eng. Abstr.) (Ger)

[Drug therapy of anxiety states] Laux G. **Krankenpfl J** 1982 Feb 15;20(2):22-4 (Ger)

[Comparative studies on the tranquilizer effect of fluspirilene and bromazepam] Thilmann J. **Med Welt** 1981 Dec 25;32(51-52):1959-61 (Ger)

[Physicochemical heterogeneity of the GABA receptors and the detection of the differences in their structural relation with benzodiazepine receptors] Korneev AIa, et al. **Zh Nevropatol Psikhiatr** 1981;81(11):1661-2 (Eng. Abstr.) (Rus)

BENZODIAZEPINONES

Clinical trial with clobazam. Kabes J, et al. **Agressologie** 1981 Oct;22(C):41-2

Subjective and psychometric assessment of effect in single application of clobazam. Molcan J, et al. **Agressologie** 1981 Oct;22(C):43-5

Antileptazol activity and kinetics of clobazam and N-desmethyl-clobazam in the guinea-pig. Ballabio M, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):192-9

Anthramycin binding to deoxyribonucleic acid-mitomycin C complexes. Evidence for drug-induced deoxyribonucleic acid conformational change and cooperativity in mitomycin C binding. Kaplan DJ, et al. **Biochemistry** 1981 Dec 22;20(26):7572-80

Clobazam kinetics in the elderly. Greenblatt DJ, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):631-6

Liquid chromatography of demoxepam and phenothiazines using a post-column photochemical reactor and fluorescence detection. Brinkman UA, et al. **J Chromatogr** 1981 Nov 6;217:463-71

Analysis of the metabolites of ethyl loflazepate by gas chromatography with electron-capture detection. Cano JP, et al. **J Chromatogr** 1981 Dec 11;226(2):413-22

Clobazam kinetics: intrasubject variability and effect of food on absorption. Divoll M, et al. **J Clin Pharmacol** 1982 Jan;22(1):69-73

Agonist and antagonist benzodiazepine receptor interaction in vitro. Möhler H, et al. **Nature** 1981 Dec 24;294(5843):763-5

Sympathetic Nerve Stimulation on the perfused rat heart. Affinities of N-methylatropine and pirenzepine at pre- and postsynaptic muscarine receptors. Fuder H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):210-9

Chronic clonazepam administration induces benzodiazepine receptor subsensitivity. Crawley JN, et al. **Neuropharmacology** 1982 Jan;21(1):85-9

Chronic benzodiazepine treatment increases [3H]muscimol binding in mouse brain. Marangos PJ, et al. **Neuropharmacology** 1982 Jan; 21(1):81-4

The effect of pirenzepine and L-hyoscyamine on gastric emptying and salivary secretion in healthy volunteers. Jaup BH, et al. **Scand J Gastroenterol** 1981;16(6):769-73

[Genetic differences in the anticonvulsant effect and rate of metabolism of phenazepam] Seredenin SB, et al. **Biull Eksp Biol Med** 1981 Oct; 91(10):450-3 (Eng. Abstr.) **(Rus)**

BIOGENIC AMINES

Cerebral monoamines and lidocaine toxicity in rats. Niederlehner JR, et al. **Anesthesiology** 1982 Mar;56(3):184-7

The effect of amine structure on complexation with lasalocid in model membrane systems. I. Identification of charged complexes in lipid bilayer membranes. Kinsel JF, et al. **Biochim Biophys Acta** 1982 Jan 22; 684(2):233-40

Distribution and activity of adrenergic and cholinergic innervation of the extrahepatic biliary system in the rabbit. Tessitore V, et al. **Cell Mol Biol** 1981;27(5):527-37

Stress-modulated alteration of brain biogenic amines in the rat: effects of L-tryptophan. Quirce CM, et al. **Commun Psychopharmacol** 1980; 4(5):371-7

Biogenic amines and beta-endorphin responses in the rat vas deferens. Miranda H, et al. **Gen Pharmacol** 1982;13(1):45-8

Selective effect of microembolization on pulmonary removal of biogenic amines. Flink JR, et al. **J Appl Physiol** 1982 Feb;52(2):421-7

Rapid and simple method for measuring biogenic amines and metabolites in brain homogenates by HPLC-electrochemical detection. Zaczek R, et al. **J Neural Transm** 1982;53(1):1-5

Amine modulation of the neurogenic Limulus heart. Augustine GJ, et al. **J Neurobiol** 1982 Jan;13(1):61-74

Effect of motor and premotor cortex ablation on concentrations of amino acids, monoamines, and acetylcholine and on the ultrastructure in rat striatum. A confirmation of glutamate as the specific cortico-striatal transmitter. Hassler R, et al. **J Neurochem** 1982 Apr;38(4):1087-98

In vitro studies of 5, 10-methylenetetrahydrofolate reductase: inhibition by folate derivatives, folate antagonists, and monoamine derivatives. Hollinger JL, et al. **J Neurochem** 1982 Mar;38(3):638-42

Central mechanisms of fenfluramine and related anorectic drugs. Garattini S. **Jpn J Pharmacol** 1981;31 Suppl:29P-35P (26 ref.)

Persistent alteration of rat brain monoamine levels by carbon monoxide exposure: sex differences and behavioral correlation. Shellenberger MK. **Neurotoxicology (Park Forest II)** 1981 Nov;2(3):431-41

[Monoamines and endogenous depression. Biochemical and pharmacological aspects] Scuvée-Moreau J, et al. **Rev Med Liege** 1982 Jan 1;37(1):1-7 **(Fre)**

[Learning in rats with differing emotional responsiveness and its relation to brain monoamines] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec;31(6):1238-46 (Eng. Abstr.) **(Rus)**

BIPOLAR DISORDER

Lithium levels in the ejaculate, spermiogram and adjuvant psychopharmacological therapy. Kolomaznik M, et al. **Act Nerv Super (Praha)** 1981;23(4):275-6

Flupenthixol decanoate in recurrent manic-depressive illness. A comparison with lithium. Ahlfors UG, et al. **Acta Psychiatr Scand** 1981 Sep;64(3):226-37

Serum lithium concentrations around the clock with different treatment regimens and the diurnal variation of the renal lithium clearance. Lauritsen BJ, et al. **Acta Psychiatr Scand** 1981 Oct;64(4):314-9

Lithium kinetics in single daily dosing. Perry PJ, et al. **Acta Psychiatr Scand** 1981 Oct;64(4):281-94

The use of the antidepressant tradozone in outpatient psychiatric practice. Soucek K, et al. **Agressologie** 1981 Nov;22(D):27

Noradrenergic drugs and affective disorders [letter] Abensour P, et al. **Am J Psychiatry** 1982 Jan;139(1):142-3

Lithium and amino acids [letter] Goodnick PJ, et al. **Am J Psychiatry** 1982 Apr;139(4):538-9

Potentiation of antidepressant effects by L-triiodothyronine in tricyclic nonresponders. Goodwin FK, et al. **Am J Psychiatry** 1982 Jan; 139(1):34-8

Phenelzine treatment without switch to mania [letter] Keitner GI. **Am J Psychiatry** 1982 Mar;139(3):386

Persistent elevation of thyroid-stimulating hormone in women with bipolar affective disorder. O'Shanick GJ, et al. **Am J Psychiatry** 1982 Apr;139(4):513-4

Questions about combined lithium and haloperidol treatment [letter] Rudorfer MV, et al. **Am J Psychiatry** 1982 Apr;139(4):537-8

Mania responsive to lecithin in a 13-year-old girl. Schreier HA. **Am J Psychiatry** 1982 Jan;139(1):108-10

Therapeutic use of the tricyclic-induced switch in bipolar manic-depression. Waters BG, et al. **Am J Psychiatry** 1982 Feb; 139(2):245-6

Treatment of intractable rapid-cycling manic-depressive disorder with levothyroxine. Clinical observations. Stancer HC, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):311-2

A new method for the use of salivary lithium concentrations as an indicator of plasma lithium levels. Selinger D, et al. **Biol Psychiatry** 1982 Jan;17(1):99-102

Poor prophylactic lithium response due to antidepressants. Reginald D, et al. **Int Pharmacopsychiatry** 1981;16(2):124-8

Rapid cyclers and antidepressants. Tondo L, et al. **Int Pharmacopsychiatry** 1981;16(2):119-23

Eye tracking in patients with unipolar and bipolar affective disorders in remission. Iacono WG, et al. **J Abnorm Psychol** 1982 Feb; 91(1):35-44

Plasma GABA in affective illness. A preliminary investigation. Petty F, et al. **J Affective Disord** 1981 Dec;3(4):339-43

Unusual presentation of manic depressive disorder in adolescence. Rogeness GA, et al. **J Clin Psychiatry** 1982 Jan;43(1):37-9

Adverse effects of lithium therapy in the acutely ill elderly patient. Smith RE, et al. **J Clin Psychiatry** 1981 Mar;43(3):94-9

Reduction of vanadate, a possible explanation of the effect of phenothiazines in manic-depressive psychosis [letter] Naylor GG, et al. **Lancet** 1982 Feb 13;1(8268):395-6

beta-Endorphin studies in psychiatric patients. Gorelick DA, et al. **Mod Probl Pharmacopsychiatry** 1981;17:236-45

Establishing lithium clinics in office practice. Hasan MK, et al. **Postgrad Med** 1982 Feb;71(2):182, 186, 190

The psychobiology of depressive disorders: from pathophysiology to predisposition. Depue RA, et al. **Prog Exp Pers Res** 1981;10:1-114 (436 ref.)

Course and relationship of lithium side effects to plasma lithium levels. Peselow ED, et al. **Psychiatr Clin (Basel)** 1981;14(3):178-83

Mood, creativity, and psychotherapeutic participation of patients receiving lithium. Phillips RH. **Psychosomatics** 1982 Jan;23(1):81-7

BRADYKININ

Chemoreceptors for serotonin (5-HT), acetylcholine (ACh), bradykinin (BK), histamine (H) and gamma-aminobutyric acid (GABA) on rabbit visceral afferent neurons. Higashi H, et al. **Brain Res Bull** 1982 Jan; 8(1):23-32

Use of 125I-labeled human serum albumin for quantitation of microvascular permeability in rat skin: reevaluation of an old method for studies on substances with an enhancing effect on microvascular permeability. Gerdin B. **J Pharmacol Methods** 1981 Nov;6(3):167-75

BUTYLAMINES

Histamine release from human basophils and isolated rat mast cells induced by ketobemidone, pethidine and the spasmolytic A29. Grosman N. **Acta Pharmacol Toxicol (Copenh)** 1982 Jan;50(1):78-80

BUTYROPHENONE TRANQUILIZERS

Development of tolerance to the stimulatory effect of neuroleptic butyrophenones on pituitary-adrenal activity in rats. Aimoto T, et al. **J Pharmacobiodyn** 1981 Nov;4(11):827-32

Disposition of timiperone, 4'-fluoro-4-[4-(2-thioxo-1-benzimidazolinyl)piperidino]butyrophenone, a neuroleptic, in the rat on repeated oral dosage. Sudo K, et al. **Xenobiotica** 1981 Oct;11(10):685-91

BUTYROPHENONES

Systemic absorption of ketocaine following epicutaneous administration. Berlin-Wahlén A, et al. **Acta Pharm Suec** 1981;18(3):113-8

Irreversible blockade of [3H]spiperone- but not [3H]dopamine-labeled dopamine receptors with phenoxybenzamine. Titeler M. **Biochem Pharmacol** 1981 Nov 15;30(22):3031-7

Opposed stages of continuous amphetamine administration: parallel alterations in motor stereotypies and in vivo spiroperidol accumulation. Ellison G, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):207-14

Inhibitory effects of ascorbic acid on the binding of [3H]dopamine antagonists to neostriatal membrane preparations: relationship to lipid peroxidation. Heikkila RE, et al. **J Neurochem** 1982 Apr; 38(4):1000-6

Ontogenetic development of the striatal [3H]spiperone binding: regulation by sodium and guanine nucleotide in rats. Nomura Y, et al. **J Neurochem** 1982 Apr;38(4):902-8

Solubilization and characterization of 3H-spiroperidol binding sites of calf caudate. Lerner MH, et al. **Life Sci** 1981 Dec 7;29(23):2367-74

Are striatal [3H]spiperone radioreceptor assays indicative of multiple dopamine receptor interactions? Clements-Jewery S, et al. **Neuropharmacology** 1981 Dec;20(12B):1295-8

Suppression of drinking and induction of sedation by a dopamine agonist is blocked by small doses of spiperone. Dourish CT, et al. **Neuropharmacology** 1982 Jan;21(1):69-72

Dopaminergic agonistic and antagonistic drugs in the ventral tegmentum of rats inhibit and facilitate changes of food-search behaviour. Oude

RD. **Neurosci Lett** 1981 Nov 18;27(1):75-80

Disposition of timiperone, 4'-fluoro-4-[4-(2-thioxo-1-benzimidazolinyl)piperidino]butyrophenon a neuroleptic, in the rat on repeated oral dosage. Sudo K, et al. **Xenobiotica** 1981 Oct;11(10):685-91

CARBAMAZEPINE

Stability of extemporaneous suspensions of carbamazepine. Burckart GJ, et al. **Am J Hosp Pharm** 1981 Dec;38(12):1929-31

Carbamazepine treatment of selected affectively disordered inpatients. Folks DG, et al. **Am J Psychiatry** 1982 Jan;139(1):115-7

Improved isocratic liquid-chromatographic simultaneous measurement of phenytoin, phenobarbital, primidone, carbamazepine, ethosuximide, and N-desmethylmethsuximide in serum. Szabo GK, et al. **Clin Chem** 1982 Jan;28(1):100-4

Severe carbamazepine poisoning. Rockoff S, et al. **Clin Toxicol** 1981 Aug;18(8):935-9

Metabolism of carbamazepine and its epoxide metabolite in human and rat liver in vitro. Tybring G, et al. **Drug Metab Dispos** 1981 Nov-Dec;9(6):561-4

Brain uptake of carbamazepine in the cat. Monaco F, et al. **Epilepsia** 1982 Feb;23(1):19-22

Preliminary study of the effects of carbamazepine on congenital orofacial defects in offspring of A/J mice. Wray SD, et al. **Epilepsia** 1982 Feb;23(1):101-10

The formation of carbamazepine epoxide by rat liver microsomes: an investigation of the biphasic kinetic profile. van Boxtel CJ, et al. **Life Sci** 1981 Dec 21;29(25):2575-84

Acute carbamazepine toxicity resulting from overdose [letter] Lawless L, et al. **Neurology (NY)** 1982 Mar;32(3):328-9

Erythromycin-carbamazepine interaction? [letter] Straughan J. **S Afr Med J** 1982 Mar 20;61(12):420-1

CARBIMAZOLE

Thyroid proliferation, body weight, thyrotropin and thyroid hormones in chronic antithyroid (carbimazole) treatment in rats. Redmond O, et al. **J Anat** 1981 Aug;133(Pt 1):37-47

CATECHOL ESTROGENS

Catecholestrogens and release of anterior pituitary glend hormones. II. Prolactin. Rodriguez-Sierra JF, et al. **Endocrinology** 1982 Feb;110(2):325-9

Catecholestrogens and release of anterior pituitary gland hormones. I. Luteinizing hormone. Rodriguez-Sierra JF, et al. **Endocrinology** 1982 Feb;110(2):318-24

Interactions of catecholestrogens with cytoplasmic and nuclear estrogen receptors in rat pituitary gland and hypothalamus. Kirchhoff J, et al. **J Neurochem** 1981 Dec;37(6):1540-7

Temporal and other effects of catechol estrogens on prolactin secretion in the rat. Shin SH, et al. **Neuroendocrinology** 1981 Dec;33(6):352-7

CATECHOLAMINES

Operant behaviour of rats after aminophylline and DH-ergotoxin in interaction with catecholamines. Tikal K. **Act Nerv Super (Praha)** 1981;23(4):319-20

Effect of manganese on synthesis of brain catecholamines in growing rats. Chandra SV, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Apr;48(4):349-54

Role of some biogenic amines in the pathomechanism of glomerulonephritis. I. Histological examinations of kidneys in acute and chronic serum sickness in rabbits. Szajner-Milart I, et al. **Acta Physiol Pol** 1981;32(4):349-62

Fetal lung maturation: amniotic fluid catecholamines, phospholipids, and cortisol. Divers WA, et al. **Am J Obstet Gynecol** 1982 Feb 15;142(4):440-4

Comparison of dopamine and dobutamine following coronary artery bypass grafting. Salomon NW, et al. **Ann Thorac Surg** 1982 Jan;33(1):48-54

Urinary excretion of catecholamines in the night monkey (Aotus trivirgatus) (Primates, Cebidae). Peyrin L, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):345-56

The involvement of the catecholaminergic system in physostigmine-induced hyperactivity in rats. Egbe PC. **Arzneimittelforsch** 1982;32(1):27-9

The effect of PEA on serotonin and catecholamines. Widelitz MM, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):1107-11

Potent inhibition of diamine oxidase with the hydroxybenzyloxamines NSD-1039, NSD-1531 and NSD-1024. Gaugas JM. **Biochem Pharmacol** 1981 Nov 15;30(22):3121-2

Ionophore mediated catecholamine release from chromaffin granules. Comparison of X-537 A and X-14547 A effects. Scherman D, et al. **Biochem Pharmacol** 1981 Dec 15;30(24):3277-83

Further studies on the effects of intravenously administered 6-hydroxydopamine on the median eminence of the rat. Smith GC, et al. **Brain Res** 1982 Feb 18;234(1):101-10

The effects of catecholamines on hemorrhagic shock in dogs. Sakahira K, et al. **Bull Tokyo Med Dent Univ** 1981 Dec;28(4):125-34

Work as a correlate of canine left ventricular oxygen consumption, and the problem of catecholamine oxygen wasting. Rooke GA, et al. **Circ Res** 1982 Feb;50(2):273-86

Variations in plasma and adrenal catecholamines and related enzymes in isolated-aggressive mice. Tizabi Y, et al. **Commun Psychopharmacol** 1980;4(5):433-9

Neurochemical and behavioural correlates of the interaction between amphetamine and delta 9-tetrahydrocannabinol in the rat. Lew EO, et al. **Drug Alcohol Depend** 1981 Sep;8(2):93-101

The role of catecholamines in the regulation of pituitary luteinizing hormone and follicle-stimulating hormone secretion. Barraclough CA, et al. **Endocr Rev** 1982 Winter;3(1):91-119 (268 ref.)

Distribution of catecholamines and serotonin in 17 portions of rat ventromedial nucleus and effect of acute immobilization stress. Kiss A, et al. **Endocrinol Exp (Bratisl)** 1981 Dec;15(4):219-28

Guanine nucleotide and magnesium ion regulation of the interaction of gonadotropic and beta-adrenergic receptors with their hormones: a comparative study using a single membrane system. Abramowitz J, et al. **Endocrinology** 1982 Feb;110(2):336-46

Effects of catecholamines on plasma free fatty acids in fed and fasted cattle. Blum JW, et al. **Endocrinology** 1982 Feb;110(2):452-6

Inhibition of the enzymatic degradation of Met-enkephalin by catecholamines. Caffrey JL, et al. **Endocrinology** 1982 Jan;110(1):291-3

A sex difference in the activation of hypothalamic catecholaminergic and luteinizing hormone-releasing hormone peptidergic neurons after acute castration. DePaolo LV, et al. **Endocrinology** 1982 Feb;110(2):531-9

Alterations of brown adipose tissue in genetically obese (ob/ob) mice. I. Demonstration of loss of metabolic response to nerve stimulation and catecholamines and its partial recovery after fasting or cold adaptation. Seydoux J, et al. **Endocrinology** 1982 Feb;110(2):432-8

Effects of catecholamines on circular and longitudinal uterine muscle of the rat. Chow EH, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):157-65

Excitability ot beta-endorphin, morphine and catecholamines of the vas deferens of the rat at different stages of development. Huidobro-Toro JP, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):115-8

Haemophilus influenzae induced loss of lung beta-adrenoceptor binding sites and modulation by changes in peripheral catecholaminergic input. Schreurs AJ, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):95-102

Agonistic actions of DPI (2-(3,4-dihydroxyphenylimino)-imidazolidine) on alpha-adrenoceptors and dopamine receptors. Woodman OL, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):11-9

Altered circadian rhythm of catecholamines in patients with apallic syndrome. Ratge D, et al. **Experientia** 1981 Nov 15;37(11):1207-9

The haloperidol effect on the histofluorescence in the caudate nucleus of the rat brain treated with agonistic and antagonistic acetylcholine compounds. Wawrzyniak M, et al. **Folia Histochem Cytochem (Krakow)** 1981;19(3):143-8

Fluorescence-displacement from the median eminence towards the arcuate nucleus at puberty. Marani E, et al. **Histochemistry** 1981;73(2):165-9

Free and conjugated catecholamines and metabolites in cat urine after hypoxia. Claustre J, et al. **J Appl Physiol** 1982 Feb;52(2):304-8

Micro high-performance liquid chromatographic system with micro precolumn and dual electrochemical detector for direct injection analysis of catecholamines in body fluids. Goto M, et al. **J Chromatogr** 1981 Nov 13;226(1):33-42

Automated measurement of catecholamines in urine, plasma and tissue homogenates by high-performance liquid chromatography with fluorometric detection. Mori K. **J Chromatogr** 1981 Nov 20;218:631-7

Cholinergic and catecholaminergic afferents to the olfactory bulb in the hamster: a neuroanatomical, biochemical, and histochemical investigation. Macrides F, et al. **J Comp Neurol** 1981 Dec 10;203(3):495-514

A modified glyoxylic acid-formaldehyde technique for histofluorescence of catecholamine-containing neurons in cryostat sections of the insect brain. Klemm N. **J Histochem Cytochem** 1982 Apr;30(4):398-400

Synthesis and adrenoceptor affinity of some highly polar beta-substituted catecholamines. Henkel JG, et al. **J Med Chem** 1981 Oct;24(10):1258-60

(alpha S)-erythro-alpha-methylepinephrine: preparation and stereoselective binding to adrenergic receptors in rat forebrain. Taylor CA Jr, et al. **J Med Chem** 1981 Oct;24(10):1261-3

Identification and localization of catecholamines in the nervous system of Limulus polyphemus. O'Connor EF, et al. **J Neurobiol** 1982 Jan;13(1):49-60

Quantitative ionophoresis of catecholamines using multibarrel carbon fibre microelectrodes. Armstrong-James M, et al. **J Neurosci Methods** 1981 Dec;4(4):385-406

The aluminum-formaldehyde (ALFA) histofluorescence method for improved visualization of catecholamines and indoleamines. 2. Model experiments. Björklund A, et al. **J Neurosci Methods** 1980 Jun; 2(3):301-18

The aluminum-formaldehyde (ALFA) histofluorescence method for improved visualization of catecholamines and indoleamines. I. A detailed account of the methodology for central nervous tissue using paraffin, cryostat or Vibratome sections. Lorén I, et al. **J Neurosci Methods** 1980 Jun;2(3):277-300

Mild zinc deficiency and undernutrition during the prenatal and postnatal periods in rats: effects on weight, food consumption, and brain catecholamine concentrations. Halas ES, et al. **J Nutr** 1982 Mar; 112(3):542-51

On the ability of domperidone to selectively inhibit catecholamine-induced relaxation of circular smooth muscle of guinea-pig stomach. Sahyoun HA, et al. **J Pharm Pharmacol** 1982 Jan; 34(1):27-33

Developmental changes in the accumulation of norepinephrine and the chronotropic effects of catecholamines in isolated rat atria as influenced by dietary lipid. Wince LC, et al. **J Pharmacol Exp Ther** 1982 Feb; 220(2):340-6

Compared efficacy of dobutamine and dopamine in association with calcium chloride on termination of cardiopulmonary bypass. d'Hollander A, et al. **J Thorac Cardiovasc Surg** 1982 Feb; 83(2):264-71

Dobutamine-induced facilitation of norepinephrine efflux from spiral strips of guinea pig pulmonary arteries. Goshima Y, et al. **Jpn J Pharmacol** 1981 Dec;31(6):1091-4

Electropharmacological actions of catecholamine in sympathetic ganglia. Multiple modes of actions to modulate the nicotinic transmission. Koketsu K. **Jpn J Pharmacol** 1981;31 Suppl:27P-28P

Calcium-dependent secretion of catecholamines from the perfused bovine adrenal medulla by sodium deprivation. Sorimachi M, et al. **Jpn J Physiol** 1981;31(5):753-56

Plasma free and sulfate conjugated catecholamine levels during acute physiological stimulation in man. Joyce DA, et al. **Life Sci** 1982 Feb 1;30(5):447-54

The effect of intracerebroventricular administration of catecholamines and their antagonists on rectal temperature of Mastomys natalensis. Shukla R, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec; 318(1):38-42

Catecholamine metabolism in rat brain. The role of neutral and acidic catechol metabolites. Thiede HM, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(1):29-35

Characterization of catecholamine binding sites in the rat brain. Agrawal AK, et al. **Neurotoxicology (Park Forest II)** 1981 Oct;2(2):365-71

The effect of angiotensin II infusion on plasma catecholamines in the conscious rabbit. Rowe BP, et al. **Proc Soc Exp Biol Med** 1981 Oct; 168(1):110-3

Catecholamines and the sodium pump in excitable cells. Phillis JW, et al. **Prog Neurobiol** 1981;17(3):141-84 (320 ref.)

CNS mediated inhibition of gastric secretion by bombesin: independence from interaction with brain catecholaminergic, and serotoninergic pathways and pituitary hormones. Taché Y, et al. **Regul Pept** 1982 Jan; 3(1):51-9

Valid evaluation of plasma catecholamines [letter] Triebig G. **Thorax** 1981 Nov;36(11):880

Identification of subcellular organelles involved in Ba2+- and Cd2+-induced adrenomedullary secretion. Shanbaky NM, et al. **Toxicol Appl Pharmacol** 1982 Jan;62(1):167-71

Cardiac output, vascular resistance and catecholamine release in hemorrhaged anephric dogs. Badder EM, et al. **Trans Am Soc Artif Intern Organs** 1981;27:330-5

[Elimination of urinary catecholamines and their metabolites after administration of atropine and of alpha and beta sympatholytics in healthy volunteers (author's transl)] Veselková A, et al. **Cas Lek Cesk** 1981;120(50):1533-6 (Eng. Abstr.) (Cze)

[Intensive physical training and its effect on the urine excretion of catecholamines and 17-OH corticoids during aerobic exercise on an ergometer (author's transl)] Veselková A, et al. **Cas Lek Cesk** 1982 Jan 22;121(3):71-3 (Eng. Abstr.) (Cze)

[Study of the catecholamines in the notochord of Anura Amphibia embryos. Its possible relationships with the adenyl-cyclase activity and the primordial germ cells migration (author's transl)] Raïs R, et al. **Arch Anat Microsc Morphol Exp** 1981;70(3):149-60 (Eng. Abstr.) (Fre)

[Cardiovascular and adrenal medullo-sympathetic reactions to acute tobacco poisoning] Dumas JP, et al. **C R Soc Biol (Paris)** 1981; 175(6):866-9 (Eng. Abstr.) (Fre)

[Neural origin and modulation by hypothalamic catecholamines of pulsatile secretion of luteinizing hormone in ovariectomized rats (author's transl)] Endo M. **Hokkaido Igaku Zasshi** 1981 Mar; 56(2):185-98 (Eng. Abstr.) (Jpn)

[Studies on catecholamine secretion from adrenal medulla—acetylcholine stimulation (author's transl)] Komiya E, et al. **Horumon To Rinsho** 1981 Aug;29(8):915-8 (Jpn)

[Urinary excretion of catecholamines by various age groups and plasma catecholamine concentrations measured by new radioenzymatic assay (author's transl)] Nakai T, et al. **Horumon To Rinsho** 1981 Aug; 29(8):909-14 (Jpn)

[Effects of diltiazem on catecholamine release from cat adrenal glands (author's transl)] Yamaguchi I, et al. **Nippon Yakurigaku Zasshi** 1981 Nov;78(5):501-9 (Eng. Abstr.) (Jpn)

[Determination of urinary catecholamine by high performance liquid chromatography (author's transl)] Tanabe T, et al. **Rinsho Byori** 1981 Sep;29(9):874-8 (Jpn)

[Changes in catecholamine concentration and myocardial contractility in focal cytotoxic lesions of the heart] Buriakov IE. **Fiziol Zh** 1981 Nov-Dec;27(6):780-5 (Eng. Abstr.) (Rus)

[Effect of damage to the superior cervical sympathetic ganglion in rabbits on microcirculation and catecholamine concentration in tissues of mucous membranes innervated by it] Dychko EN, et al. **Fiziol Zh** 1982 Jan-Feb;28(1):15-9 (Eng. Abstr.) (Rus)

[Changes in catecholamine excretion in adolescents at high altitudes] Nagnibeda NN, et al. **Fiziol Zh** 1982 Jan-Feb;28(1):91-2 (Rus)

[Effect of cold on catecholamine fluorescence in various rat brain structures] Vorodaevskaia GI. **Fiziol Zh** 1982 Jan-Feb;28(1):86-8 (Rus)

[Effect of electric stimulation of the stellate ganglion and inclusion of the adrenals on catecholamine concentration in the isolated heart] Barinov EF. **Fiziol Zh SSSR** 1981 Oct;67(10):1501-5 (Eng. Abstr.) (Rus)

[Comparative characteristics of the reactions of small intestine vessels to neurogenic influences and catecholamine application] Polenov SA, et al. **Fiziol Zh SSSR** 1981 Dec;67(12):1845-52 (Eng. Abstr.) (Rus)

[Catecholamine concentration of the blood of rats after a flight on the Cosmos-936 biosatellite] Kvetnianski R, et al. **Kosm Biol Aviakosm Med** 1982 Jan-Feb;16(1):80-3 (Eng. Abstr.) (Rus)

[Spectrofluorometric determination of catecholamines and dihydroxyphenylalanine in 1 sample] Sominskii VN, et al. **Lab Delo** 1982;(1):11-5 (Eng. Abstr.) (Rus)

[Catecholamine regulation of the liver and kidney ATPase activity in mice] Krut'ko BT. **Probl Endokrinol (Mosk)** 1982 Jan-Feb; 28(1):73-8 (Eng. Abstr.) (Rus)

[Catecholaminergic and serotoninergic systems in depression] Puzhin'skii S, et al. **Vestn Akad Med Nauk SSSR** 1982;(1):66-8 (Eng. Abstr.) (Rus)

[Nature of urinary catecholamine excretion in the glossalgia syndrome] Dychko EN. **Vrach Delo** 1981 Dec;(12):93-5 (Rus)

[Psychological component of human stress (author's transl)] Vargas Fernández L. **Rev Med Chil** 1981 May;109(5):441-51 (Eng. Abstr.) (Spa)

CHILD BEHAVIOR DISORDERS

Treatment of childhood aggressivity with lithium. Vetro A, et al. **Agressologie** 1981 Nov;22(E):27-30

Biochemical differences in children with conduct disorder socialized and undersocialized. Rogeness GA, et al. **Am J Psychiatry** 1982 Mar; 139(3):307-11

CHLORDIAZEPOXIDE

Pimozide versus chlordiazepoxide in anxiety neurosis. Doongaji DR, et al. **Acta Psychiatr Belg** 1981 Jul-Aug;81(4):416-23

Adverse reactions to benzodiazepine-tricyclic antidepressant compound. Beresford TP, et al. **J Clin Psychopharmacol** 1981 Nov;1(6):392-4

Chronic benzodiazepine treatment increases [3H]muscimol binding in mouse brain. Marangos PJ, et al. **Neuropharmacology** 1982 Jan; 21(1):81-4

Evidence of a role for GABA in benzodiazepine effects on food preference in rats. Hodges HM, et al. **Psychopharmacology (Berlin)** 1981; 75(3):305-10

Effects of chronic chlordiazepoxide treatment on novel and familiar food preference in rats. Hodges HM, et al. **Psychopharmacology (Berlin)** 1981; 75(3):311-4

Chlordiazepoxide and resistance to punishment. Davis NM, et al. **Q J Exp Psychol [B]** 1981 Nov;33(Pt 4):227-39

P-CHLOROPHENYLALANINE

Effect of tryptophan administration on spontaneous and P-CPA-induced muricidal aggression in laboratory rats. Valzelli L, et al. **Pharmacol Res Commun** 1981 Oct;13(9):891-7

Effect of parachlorophenylalanine on the incidence of abnormal behaviors observed following diazepam withdrawal. Suzuki T, et al. **Prog Neuropsychopharmacol** 1981;5(4):415-7

CHLORPROMAZINE

Effect of chlorpromazine on the ultrastructure of Staphylococcus aureus. Kristiansen JE, et al. **Acta Pathol Microbiol Scand [B]** 1981 Dec; 89(6):399-405

Hydrolysis of sarcolemma by lysosomal lipases and inhibition by chlorpromazine. Beckman JK, et al. **Am J Physiol** 1982 Apr; 242(4):H652-6

A study on the effect of chlorpromazine and desipramine on the activity of some adrenal enzymes. Chan MY, et al. **Biochem Pharmacol** 1981 Dec 15;30(24):3365-7

Metabolism of chlorpromazine by pulmonary microsomal enzymes in the rat and rabbit. Ohmiya Y, et al. **Biochem Pharmacol** 1982 Jan 15; 31(2):157-62

Effect of chlorpromazine on isolated rat hepatocytes. Tsao SC, et al. **Biochem Pharmacol** 1982 Feb 15;31(4):491-7

Fluidity of human erythrocyte membrane and effect of chlorpromazine on fluidity and phase separation of membrane. Ogiso T, et al. **Biochim Biophys Acta** 1981 Dec 7;649(2):325-35

Divalent cations and chlorpromazine can induce non-bilayer structures in phosphatidic acid-containing model membranes. Verkleij AJ, et al. **Biochim Biophys Acta** 1982 Jan 22;684(2):255-62

Retinal amacrine cell system tyrosine hydroxylase: the development of responsiveness to light and neuroleptic drugs. Cohen J, et al. **Brain Res** 1982 Jan;255(1):160-3

The effect of long-term chlorpromazine and desipramine treatment on adrenal corticosterone, cyclic AMP, and cholesterol distribution in rats. Hung F, et al. **Clin Exp Pharmacol Physiol** 1981 Dec;8(6):567-74

Interaction of chlorpromazine and nortriptyline in patients with schizophrenia. Loga S, et al. **Clin Pharmacokinet** 1981 Nov-Dec; 6(6):454-62

Cigarette smoking and chlorpromazine disposition and actions. Pantuck EJ, et al. **Clin Pharmacol Ther** 1982 Apr;31(4):533-8

Actions of chlorpromazine metabolites on brain guanylate cyclase. Pajer KA, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):137-9

Simultaneous determination of chlorpromazine and levomepromazine in human plasma and urine by high-performance liquid chromatography using electrochemical detection. Murakami K, et al. **J Chromatogr** 1982 Jan 8;227(1):103-12

Pimozide versus chlorpromazine in chronic schizophrenia: a 52 week double-blind study of maintenance therapy. Wilson LG, et al. **J Clin Psychiatry** 1982 Feb;43(2):62-5

Effect of carboxylic acids on permeation of chlorpromazine through dimethyl polysiloxane membrane. Gasco MR, et al. **J Pharm Sci** 1982 Feb;71(2):239-41

Drug management in chronic schizophrenia. Tune LE, et al. **Johns Hopkins Med J** 1982 Jan;150(1):45-8

The influence of amitriptyline, imipramine and chlorpromazine on activity of arginase in rat's brain and liver. Grabowska-Hibner J, et al. **Mater Med Pol** 1981 Jan-Mar;13(1):54-7

Chlorpromazine reduces the perceptual ambiguity of a reversible visual figure. Harris JP, et al. **Neuropharmacology** 1981 Dec;20(12B):1337-8

Relationship between plasma-levels of chlorpromazine and effects on EEG and evoked potentials in healthy volunteers. Laurian S, et al. **Pharmacopsychiatria** 1981 Nov;14(6):199-204

Does a plasma level of chlorpromazine help? Van Putten T, et al. **Psychol Med** 1981 Nov;11(4):729-34

[Sensitivity of albino and black mice to various drugs chemically related to melanins] Zarach-Krutysza M. **Acta Pol Pharm** 1981;38(4):513-8 **(Pol)** (Eng. Abstr.)

CHOICE BEHAVIOR

The effect of intrahypothalamic serotonin reinforcement on directional preference in rats. Lesiecka M, et al. **Acta Neurobiol Exp (Warsz)** 1981; 41(5):439-46

CLOMIPRAMINE

On the clinical response/plasma level relationship for clomipramine [letter] Dutt JE. **Br J Psychiatry** 1982 Jan;140:105

Clomipramine and exposure for chronic obsessive-compulsive rituals: III. Two year follow-up and further findings. Mawson D, et al. **Br J Psychiatry** 1982 Jan;140:11-8

3-Chlorodibenzazepine binding to cholinergic receptors and ion channels. Aronstam RS, et al. **Res Commun Chem Pathol Pharmacol** 1981 Dec; 34(3):551-4

[Analysis of controlled studies comparing mianserin and clomipramine (author's transl)] de Buck RP. **Encephale** 1981;7(4 Suppl):455-72 (Eng. Abstr.) **(Fre)**

[Clomipramine and desmethylclomipramine: relationship between plasma levels and clinical effect (author's transl)] Vandel B, et al. **Encephale** 1981;7(5):601-8 (Eng. Abstr.) **(Fre)**

COCAINE

The use of diazepam and of cocaine in combination with other drugs by Los Angeles County probationers. Budd RD. **Am J Drug Alcohol Abuse** 1981;8(2):249-55

Fatalities from cocaine overdoses in Los Angeles County. Nakamura GR, et al. **Clin Toxicol** 1981 Aug;18(8):895-905

Origin of cocaine- and lidocaine-induced spindle activity within the olfactory forebrain of the rat. Stripling JS. **Electroencephalogr Clin Neurophysiol** 1982 Feb;53(2):208-19

Cocaine self-administration in humans. Fischman MW, et al. **Fed Proc** 1982 Feb;41(2):241-6

Cocaine effects on gingiva [letter] Dello Russo NM, et al. **J Am Dent Assoc** 1982 Jan;104(1):13

Binding of [3H]cocaine in mouse brain: kinetics and saturability. Reith ME, et al. **J Recept Res** 1981;2(3):233-43

Cocaine-induced supersensitivity of striatal dopamine receptors: role of endogenous calmodulin. Memo M, et al. **Neuropharmacology** 1981 Dec; 20(12A):1145-50

Comparative stimulus properties of two fractions of the coca leaf (E. coca). Bedford JA, et al. **Pharmacol Biochem Behav** 1981 Dec; 15(6):907-9

Reinstatement of cocaine-reinforced responding in the rat. de Wit H, et al. **Psychopharmacology (Berlin)** 1981;75(2):134-43

COGNITION

The efficacy of cognitive therapy in depression: a treatment trial using cognitive therapy and pharmacotherapy, each alone and in combination. Blackburn IM, et al. **Br J Psychiatry** 1981 Sep;139:181-9

Cognitive therapy for depression [editorial] Goldberg D. **Br Med J [Clin Res]** 1982 Jan 16;284(6310):143-4

COGNITION DISORDERS

Pharmacological treatment of chronic cognitive deficit: a review. Dowson JH. **Compr Psychiatry** 1982 Jan-Feb;23(1):85-98

Altered circadian rhythm of catecholamines in patients with apallic syndrome. Ratge D, et al. **Experientia** 1981 Nov 15;37(11):1207-9

Vasopressin treatment of cognitive dysfunction in progressive dementia. Weingartner H, et al. **Life Sci** 1981 Dec 28;29(26):2721-6

COLOR PERCEPTION

Subjective colours and brain function. Shute CC. **Endeavour** 1981; 5(4):141-6

Digitalis toxicity mistaken for jaundice. Dickstein ES. **Geriatrics** 1982 Apr;37(4):133, 137-8

Phencyclidine discrimination in the pigeon using color tracking under second-order schedule. McMillan DE, et al. **J Exp Anal Behav** 1982 Jan;37(1):143-7

CONCEPT FORMATION

Effects of chemicals on delayed matching behavior in pigeons I: acute effects of drugs. McMillan DE. **Neurotoxicology (Park Forest II)** 1981 Nov;2(3):485-98

CONDITIONING (PSYCHOLOGY)

Pimozide attenuates conditioned taste preferences induced by self-stimulation in rats. Ettenberg A, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):915-9

Endogenous corticosterone alterations and appetitive learning in the rat. O'Reilly HM, et al. **Physiol Behav** 1981 Sep;27(3):515-22

CONDITIONING, CLASSICAL

Piribedil-induced anti-hypoxic protection in rats. Saligaut C, et al. **Aviat Space Environ Med** 1982 Jan;53(1):35-9

Role of cholinergic and monoaminergic brain systems in dissociated learning. Arkhipov VI, et al. **Neurosci Behav Physiol** 1981 May-Jun; 11(3):226-9

Correlation between retention of defensive conditioned reflexes and brain acetylcholinesterase activity in rats. Dish TN. **Neurosci Behav Physiol** 1981 May-Jun;11(3):230-3

Effect of serotonin injected into the amygdala on conditioned and unconditioned food reflexes and the EEG in cats. Gasanov GG, et al. **Neurosci Behav Physiol** 1981 May-Jun;11(3):207-12

Effect of serotonin on formation and fixation of various conditioned reflexes. Getsova VM. **Neurosci Behav Physiol** 1981 May-Jun; 11(3):280-5

Analog of a conditioned reflex of sensomotor cortical units following microinjection of acetylcholine. Kopytova FV, et al. **Neurosci Behav Physiol** 1981 May-Jun;11(3):213-20

Effects of bilateral amygdala lesions on neophobia and conditioned taste aversion in mice. Shimai S, et al. **Percept Mot Skills** 1982 Feb; 54(1):127-30

[Binding of 3H-diazepam by cerebral cortex synaptic membranes in the rat during conditioned reflex elaboration] Korotkov KO, et al. **Biull Eksp Biol Med** 1981 Dec;92(12):695-6 (Eng. Abstr.) **(Rus)**

[Effect of high doses of phenamine on instrumental defensive reflexes in intact and striatectomized rats] Baturin VA. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec;31(6):1305-7 (Rus)

CONDITIONING, OPERANT

Operant behaviour of rats after aminophylline and DH-ergotoxin in interaction with catecholamines. Tikal K. **Act Nerv Super (Praha)** 1981; 23(4):319-20

The effects of 2,5-dimethoxy-4-methylamphetamine (DOM) on operant behavior: interactions with other neuroactive agents. Commissaris RL, et al. **Commun Psychopharmacol** 1980;4(5):393-404

Unlimited access intravenous drug self-administration in rhesus monkeys. Balster RL, et al. **Fed Proc** 1982 Feb;41(2):211-5

Drugs as reinforcers in animals and humans: introduction. Balster RL, et al. **Fed Proc** 1982 Feb;41(2):209-10

Operant thermoregulation of rats with anterior hypothalamic lesions. Schulze G, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec; 318(1):43-8

Antagonism by methysergide of the effects of L-5-hydroxytryptophan and quipazine on schedule-controlled responding. Leander JD. **Neuropharmacology** 1981 Dec;20(12A):1141-3

Comparative stimulus properties of two fractions of the coca leaf (E. coca). Bedford JA, et al. **Pharmacol Biochem Behav** 1981 Dec; 15(6):907-9

Phencyclidine in combination with pentobarbital: supra-additive effects on complex operant behavior in patas monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):159-65

A comparison of some behavioural effects of amphetamine and electrical brain stimulation of the mesolimbic dopamine system in rats. D'Mello GD. **Psychopharmacology (Berlin)** 1981;75(2):184-92

Two opposite effects of diazepam on fear by differential training in the CER-paradigm. Haug T, et al. **Psychopharmacology (Berlin)** 1981; 75(2):110-3

Chlordiazepoxide and resistance to punishment. Davis NM, et al. **Q J Exp Psychol [B]** 1981 Nov;33(Pt 4):227-39

[Effects of afloqualone, a new centrally acting muscle relaxant, on DRL response and CER in rats (author's transl)] Yamamura M, et al. **Nippon Yakurigaku Zasshi** 1981 Oct;78(4):381-92 (Eng. Abstr.) (Jpn)

[Effects of piracetam in healthy dogs and dogs with experimental neuroses] Airapetiants MG, et al. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec; 31(6):1164-70 (Eng. Abstr.) (Rus)

CONFLICT (PSYCHOLOGY)

Sodium valproate exerts anti-conflict activity in rats without any concomitant rise in forebrain GABA level. Rasmussen KJ, et al. **Life Sci** 1981 Nov 23;29(21):2163-70

A water lick conflict paradigm using drug experienced rats. Petersen EN, et al. **Psychopharmacology (Berlin)** 1981;75(3):236-9

CORTICOSTERONE

Conformation-activity relationships of corticotropin segments. Löw M, et al. **Acta Biochim Biophys Acad Sci Hung** 1981;16(1-2):105-8

Glucose and endocrine responses to hypothalamic electrical stimulation in rats. Dubuc PU, et al. **Am J Physiol** 1982 Mar;242(3):R220-6

Effects of petroleum on adrenocortical activity and on hepatic naphthalene-metabolizing activity in mallard ducks. Gorsline J, et al. **Arch Environ Contam Toxicol** 1981 Nov;10(6):765-77

Effect of corticosterone on the urinary output of Nt-methylhistidine in mature male rats. Santidrián S. **Arch Farmacol Toxicol** 1981 Aug; 7(2):283-8

Inhibition of collagen and sulfated glycosaminoglycan synthesis in neonatal mouse dermal fibroblasts by corticosterone. Verbruggen LA, et al. **Biochem Pharmacol** 1981 Dec 15;30(24):3285-9

The effect of the administration of the adrenocorticotrophic hormone to rats on in vivo steroidogenesis and on the reduction cytochrome P-450 in adrenal mitochondria. Koritz SB. **Biochim Biophys Acta** 1982 Feb 2;714(2):382-5

The effect of long-term chlorpromazine and desipramine treatment on adrenal corticosterone, cyclic AMP, and cholesterol distribution in rats. Hung F, et al. **Clin Exp Pharmacol Physiol** 1981 Dec;8(6):567-74

Glucocorticoid regulation of alpha-lactalbumin production in long-term cultures of normal rat mammary cells. Ray DB, et al. **Endocr Res Commun** 1981;8(3):165-78

Stress-induced inhibition of the plasma corticosterone response to a subsequent stress in rats: a nonadrenocorticotropin-mediated mechanism. De Souza EB, et al. **Endocrinology** 1982 Jan; 110(1):23-33

In vivo corticotropin-releasing factor-induced secretion of adrenocorticotropin, beta-endorphin, and corticosterone. Rivier C, et al. **Endocrinology** 1982 Jan;110(1):272-8

Dopaminergic modulation of aldosterone secretion in the rhesus monkey: evidence that dopamine affects the late pathway of aldosterone biosynthesis by inhibiting the conversion of corticosterone to 18-hydroxycorticosterone. Sowers JR, et al. **Endocrinology** 1982 Apr; 110(4):1173-7

Adrenal steroid-induced changes in beta-adrenergic receptor binding in rat hippocampus. Roberts DC, et al. **Eur J Pharmacol** 1981 Aug 27; 74(1):37-41

Sexual differentiation of hepatic metabolism of corticosterone and testosterone in the rat. Rahman R, et al. **J Biochem (Tokyo)** 1981 Dec; 90(6):1567-75

Effect of corticosterone on serum concentrations of alpha 2 micro-globulin and on spermatogenesis in oestrogen-treated rats. [illegible] NM, et al. **J Endocrinol** 1982 Feb;92(2):309-14

Effects of an intermittent lighting schedule on the time of egg-laying and the levels of luteinizing hormone, progesterone and corticosterone in the plasma of the domestic hen. Duplaix M, et al. **J Endocrinol** 1981 Dec;91(3):375-83

Subcellular compartmentation of steroidogenesis in the zona fasciculata/reticularis of the rat adrenal cortex. McCredie E, et al. **J Steroid Biochem** 1981 Dec;14(12):1269-77

Beta-adrenergic stimulation induces an increase of the plasma levels of immunoreactive alpha-MSH, beta-endorphin, ACTH and of corticosterone. Berkenbosch F, et al. **Life Sci** 1981 Nov 30; 29(22):2249-56

On the interactive role of central noradrenaline neurons and corticosterone in two-way active avoidance acquisition in the rat. Archer T, et al. **Neurosci Lett** 1981 Dec 23;27(3):341-6

Arginine vasotocin: effects on open field behavior, whole brain monoamines and plasma corticosterone. Golus P, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):437-40

Repeated administration of pergolide to rats attenuates the acute elevation of serum corticosterone by pergolide. Fuller RW, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):933-6

Endogenous corticosterone alterations and appetitive learning in the rat. O'Reilly HM, et al. **Physiol Behav** 1981 Sep;27(3):513-22

Behavioral and corticosterone effects in conditioned taste aversion following hippocampal lesions. Smotherman WP, et al. **Physiol Behav** 1981 Oct;27(4):569-74

Diurnal patterns of food intake and plasma corticosterone levels in lactating rats. Tachi N, et al. **Physiol Behav** 1981 Sep;27(3):481-6

Changes in corticosterone levels in iron deficient rats. Williamson AM, et al. **Physiol Behav** 1981 Dec;27(6):1085-8

Hyperprolactinemia and hyperadrenocorticism accompanied by normal blood pressure in Sprague-Dawley rats. McMurtry JP, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):114-8

Effect of corticosterone, hydrocortisone and prostaglandin fatty acid precursors on the spontaneous motility of the uterus isolated from ovariectomized rats. Bonacossa A, et al. **Prostaglandins** 1982 Jan; 23(1):113-28

[Effects of the destruction of the suprachiasmatic nuclei on the circadian rhythms of ACTH corticosterone and the general activity of female rats exposed to a aperiodic environment] Szafarczyk A, et al. **C R Soc Biol (Paris)** 1981;175(6):801-10 (Eng. Abstr.) (Fre)

[Effect of arginine vasotocin, oxytocin and their fragments on the corticosterone content in the blood plasma of chickens of different ages] Sirotkin AV, et al. **Fiziol Zh SSSR** 1982 Jan;68(1):112-5 (Eng. Abstr.) (Rus)

CORTICOTROPIN

Conformation-activity relationships of corticotropin segments. Löw M, et al. **Acta Biochim Biophys Acad Sci Hung** 1981;16(1-2):105-8

The effect of ACTH stimulation on plasma steroids in two patients with congenital hypoaldosteronism and in their relatives. Drop SL, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):245-50

Effects of ACTH on the zona glomerulosa of sodium-loaded timolol maleate-treated rats: stereology and plasma hormone concentrations. Nussdorfer GG, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):256-62

The effect of the administration of the adrenocorticotrophic hormone to rats on in vivo steroidogenesis and on the reduction cytochrome P-450 in adrenal mitochondria. Koritz SB. **Biochim Biophys Acta** 1982 Feb 2;714(2):382-5

ACTH 1-24 and lysine vasopressin selectively activate dopamine synthesis in frontal cortex. Delanoy RL, et al. **Brain Res** 1982 Jan 7; 231(1):117-29

Changes in corticotropic responsiveness and mitochondrial ultrastructure of adrenocortical cells from the inner zone of the duck (Anas platyrhynchos) adrenal gland: the effects of cycloheximide, puromycin, and chloramphenicol. Pearce RB, et al. **Cell Tissue Res** 1981; 221(1):45-57

Stress-induced inhibition of the plasma corticosterone response to a subsequent stress in rats: a nonadrenocorticotropin-mediated mechanism. De Souza EB, et al. **Endocrinology** 1982 Jan; 110(1):23-33

Specific inhibition by glucocorticoids of the alpha 2-adrenergic stimulation of adrenocorticotropin release in rat anterior pituitary cells. Giguère V, et al. **Endocrinology** 1982 Apr;110(4):1225-30

Characterization of an early inhibitory effect of glucocorticoids on stimulated adrenocorticotropin and endorphin release from a clonal ain of mouse pituitary cells. Phillips M, et al. **Endocrinology** 1982 Mar;110(3):892-900

In vivo corticotropin-releasing factor-induced secretion of adrenocorticotropin, beta-endorphin, and corticosterone. Rivier C, et al. **Endocrinology** 1982 Jan;110(1):272-8

Adrenergic mechanisms involved in the control of pituitary-adrenal activity in the rat: a beta-adrenergic stimulatory mechanism. Tilders FJ, et al. **Endocrinology** 1982 Jan;110(1):114-20

Biosynthesis of pairs of peptides related to melanotropin, corticotropin and endorphin in the pars intermedia of the amphibian pituitary gland. Martens GJ, et al. **Eur J Biochem** 1982 Feb;122(1):1-10

ACTH1-24 counteracts the prolactin-releasing effect of an opioid. Ferri S, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):143-5

ACTH1-24 increases stimulation-evoked noradrenaline release from sympathetic nerves by acting on presynaptic ACTH receptors. Göthert M. **Eur J Pharmacol** 1981 Dec 3;76(2-3):295-6

A quantitative approach to trace the corticotrophs in culture after adrenalectomy. Kappay G, et al. **Histochemistry** 1981;73(1):131-6

Lipolytic and enkephalinase inhibitory activities of polypeptides from placental autolysate prepared for therapeutic purposes. Nencini P, et al. **Int J Tissue React** 1981 Dec;3(3-4):167-72

Presence of immunoreactive gamma-melanocyte-stimulating hormone, adrenocorticotropin, and beta-endorphin in human gastric antral mucosa. Tanaka I, et al. **J Clin Endocrinol Metab** 1982 Feb;54(2):392-6

Effect of cortisol or adrenocorticotrophin on release of luteinizing hormone induced by luteinizing hormone releasing hormone in the dairy heifer. Matteri RL, et al. **J Endocrinol** 1982 Jan;92(1):141-6

Beta-adrenergic stimulation induces an increase of the plasma levels of immunoreactive alpha-MSH, beta-endorphin, ACTH and of corticosterone. Berkenbosch F, et al. **Life Sci** 1981 Nov 30;29(22):2249-56

Influence of adrenocorticotropin and adrenalectomy on gonadotropin secretion in immature rats. Mann DR, et al. **Neuroendocrinology** 1982 Jan;34(1):20-6

Evidence that the effects of 5-hydroxytryptophan on the secretion of ACTH and growth hormone in dogs are not mediated by central release of serotonin. Zimmermann H, et al. **Neuroendocrinology** 1982 Jan;34(1):27-31

In vivo and in vitro release of ACTH by synthetic CRF. Turkelson CM, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):425-9

Digoxin-like immunoreactivity of certain steroid and other hormones. Schreiber V, et al. **Physiol Bohemoslov** 1981;30(6):569-71

Human lymphocyte production of corticotropin and endorphin-like substances: association with leukocyte interferon. Smith EM, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7530-4

Running elevates plasma beta-endorphin immunoreactivity and ACTH in untrained human subjects. Gambert SR, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):1-4

[Effects of the destruction of the suprachiasmatic nuclei on the circadian rhythms of ACTH corticosterone and the general activity of female rats exposed to a aperiodic environment] Szafarczyk A, et al. **C R Soc Biol (Paris)** 1981;175(6):801-10 (Eng. Abstr.) **(Fre)**

[Effect of allopurinol on the liberation of free fatty acids from isolated rat and rabbit adipose tissue, stimulated by noradrenaline or adrenocortico-tropic hormone] Sziegoleit W, et al. **Acta Biol Med Ger** 1981;40(6):881-3 **(Ger)**

CORTICOTROPIN RELEASING HORMONE

In vivo corticotropin-releasing factor-induced secretion of adrenocorticotropin, beta-endorphin, and corticosterone. Rivier C, et al. **Endocrinology** 1982 Jan;110(1):272-8

Corticotropin-releasing factor: effects on the sympathetic nervous system and oxygen consumption. Brown MR, et al. **Life Sci** 1982 Jan 11;30(2):207-10

Distribution and characterization of corticotropin-releasing factor and arginine vasopressin in rat hypothalamic nuclei. Hashimoto K, et al. **Neuroendocrinology** 1982 Jan;34(1):32-7

In vivo and in vitro release of ACTH by synthetic CRF. Turkelson CM, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):425-9

CREATIVENESS

Mood, creativity, and psychotherapeutic participation of patients receiving lithium. Phillips RH. **Psychosomatics** 1982 Jan;23(1):81-7

CROSS-CULTURAL COMPARISON

A cross-national comparison of patterns of utilization and psychiatric care. Erinosho OA, et al. **Int J Soc Psychiatry** 1981 Winter;27(4):289-96

Cross-cultural study of a biochemical abnormality in paranoid schizophrenia. Jeste DV, et al. **Psychiatry Res** 1981 Dec;5(3):341-52

DANSYL COMPOUNDS

The effect of occlusive treatment on human skin: an electron microscopic study on epidermal morphology as affected by occlusion and dansyl chloride. Lindberg M, et al. **Acta Derm Venereol (Stockh)** 1982;62(1):1-5

5-(dimethylamino)naphthalene-1-sulfonic acid, a fluorescent probe of the medium chain fatty acid binding site of serum albumin. Doody MC, et al. **Biochemistry** 1982 Jan 5;21(1):28-33

Interaction of alpha-dansylated peptide inhibitors with porcine pepsin: detection of complex formation by fluorescence energy transfer and chromatography and evidence for a two-step binding scheme. Dunn BM, et al. **Biochemistry** 1981 Dec 8;20(25):7206-11

Cycloheptaamylose-dansyl chloride complex as a fluorescent label of surface membranes in living ciliates. Wyroba E, et al. **Histochemistry** 1981 Dec;73(3):459-67

Dansyl chloride labeling of Pseudomonas aeruginosa treated with pyocin R1: change in permeability of the cell envelope. Uratani Y. **J Bacteriol** 1982 Feb;149(2):523-8

DEMENTIA

Vasopressin treatment of cognitive dysfunction in progressive dementia. Weingartner H, et al. **Life Sci** 1981 Dec 28;29(26):2721-6

DEPRESSION

Amoxapine, an observation, and a perspective on MAOIs and their safety [editorial] Shader RI, et al. **J Clin Psychopharmacol** 1981 Sep;1(5):263

Alpha 2 adrenergic receptors in depression [editorial] **Lancet** 1982 Apr 3;1(8275):781

beta-Endorphin studies in psychiatric patients. Gorelick DA, et al. **Mod Probl Pharmacopsychiatry** 1981;17:236-45

[Therapy of anorexia nervosa aimed at depressive manifestations] Kadlecová B. **Cesk Pediatr** 1981 Nov;36(11):666-7 **(Cze)**

[Depressions of the third age] Le Goues G. **Soins Psychiatr** 1982 Jan;(15):19-23 **(Fre)**

[Biochemistry of depression. Comments and correction (letter)] Bánki C. **Orv Hetil** 1982 Jan 17;123(3):127 **(Hun)**

[Depression, a public health problem] Calderón Narváez G. **Salud Publica Mex** 1981 Sep-Oct;23(5):503-8 (Eng. Abstr.) **(Spa)**

DEPRESSION, INVOLUTIONAL

A trial of dextroamphetamine in patients with involutional agitated depression. Ward NG, et al. **J Clin Psychiatry** 1982 Jan;43(1):35-6

[Influence of the seasons on the course and therapeutic results of depressive phases of maniomelancholy (author's transl)] Sedivec V. **Cesk Psychiatr** 1981 Oct;77(5):326-30 (Eng. Abstr.) **(Cze)**

[Introduction to the clinical problems of psychological disorders in involution (author's transl)] Vencovský E. **Cesk Psychiatr** 1981;77(4):232-6 (Eng. Abstr.) **(Cze)**

[Depressions in old age] Fedortsov VI. **Med Sestra** 1982 Jan;41(1):14-7 **(Rus)**

DEPRESSIVE DISORDER

A neurochemical theory of appetite and weight changes in depressive states. Hopkinson G. **Acta Psychiatr Scand** 1981 Sep;64(3):217-25

Duration of REM sleep latency as predictor of effect of antidepressant therapy. A preliminary report. Svendsen K, et al. **Acta Psychiatr Scand** 1981 Sep;64(3):238-43

Do have antidepressants of the second generation anxiolytic properties? Kabes J, et al. **Agressologie** 1981 Nov;22(E):11-3

Treatment of anxious depression with intravenous infusions of a combination of drugs. Krebs-Roubicek E, et al **Agressologie** 1981 Nov;22(D):25-6

Tofizopam in the therapy of anxious-depressive syndromes. Molcan J, et al. **Agressologie** 1981 Nov;22(D):23-4

The therapeutic effect of Trazodon with endogenous depressions. Peterova E, et al. **Agressologie** 1981 Nov;22(E):25

Amitriptyline levels and clinical effects. Quednow B, et al. **Agressologie** 1981 Nov;22(E):15-8

Anxiety in climax and its pharmacological treatment. Tondlova H, et al. **Agressologie** 1981 Nov;22(E):7-8

Recurrence of depression after discontinuation of long-term amitriptyline treatment. Bialos D, et al. **Am J Psychiatry** 1982 Mar;139(3):325-9

Potentiation of antidepressant effects by L-triiodothyronine in tricyclic nonresponders. Goodwin FK, et al. **Am J Psychiatry** 1982 Jan;139(1):34-8

Case report of painful ejaculation as a side effect of amoxapine. Kulik FA, et al. **Am J Psychiatry** 1982 Feb;139(2):234-5

True and pseudo cholinesterases in depression. Mathew RJ, et al. **Am J Psychiatry** 1982 Jan;139(1):125-7

Lorazepam and desipramine serum concentration [letter] Rosenblatt JE. **Am J Psychiatry** 1982 Apr;139(4):536-7

Toward a biochemical classification of depressive disorders, V: Heterogeneity of unipolar depressions. Schatzberg AF, et al. **Am J Psychiatry** 1982 Apr;139(4):471-5

Case report of inhibition of ejaculation and retrograde ejaculation as side effects of amoxapine. Schwarcz G. **Am J Psychiatry** 1982 Feb; 139(2):233–4

Relationship between plasma antidepressant levels and clinical outcome for inpatients receiving imipramine. Simpson GM, et al. **Am J Psychiatry** 1982 Mar;139(3):358–60

Steady-state plasma imipramine levels in prepubertal depressed children. Weller EB, et al. **Am J Psychiatry** 1982 Apr;139(4):506–8

Variability of hormonal responses to a series of neuroendocrine challenges in depressed patients. Winokur A, et al. **Am J Psychiatry** 1982 Jan; 139(1):39–44

Adrenergic receptor sensitivity in depression. Effects of clonidine in depressed patients and healthy subjects. Charney DS, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):290–4

The peripheral kinetics of norepinephrine in depressive illness. Esler M, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):295–300

EEG spectral analysis in vital depression: ultradian cycles. Lange H. **Biol Psychiatry** 1982 Jan;17(1):3–21

Platelet serotonin uptake in depressed patients: circadian effect. Rausch JL, et al. **Biol Psychiatry** 1982 Jan;17(1):121–3

The efficacy of cognitive therapy in depression: a treatment trial using cognitive therapy and pharmacotherapy, each alone and in combination. Blackburn IM, et al. **Br J Psychiatry** 1981 Sep;139:181–9

Lithium continuation therapy following electroconvulsive therapy. Coppen A, et al. **Br J Psychiatry** 1981 Oct;139:284–7

Nortriptyline therapy in elderly patients: dosage prediction from plasma concentration at 24 hours after a single 50 mg dose. Dawling S, et al. **Br J Psychiatry** 1981 Nov;139:413–6

On the clinical response/plasma level relationship for clomipramine [letter] Dutt JE. **Br J Psychiatry** 1982 Jan;140:105

Cognitive therapy for depression [editorial] Goldberg D. **Br Med J [Clin Res]** 1982 Jan 16;284(6310):143–4

Decreased 3H-imipramine binding in depressed males and females. Asarch KB, et al. **Commun Psychopharmacol** 1980;4(5):425–32

Alterations in noradrenergic function during clorgyline treatment. Pickar D, et al. **Commun Psychopharmacol** 1980;4(5):379–86

Toward a biochemical classification of depressive disorders IV: Pretreatment urinary MHPG levels as predictors of antidepressant response to imipramine. Schatzberg AF, et al. **Commun Psychopharmacol** 1980;4(5):441–5

Therapies of depression. Rosen H. **Curr Psychiatr Ther** 1981; 20:301–11

Poor prophylactic lithium response due to antidepressants. Reginaldi D, et al. **Int Pharmacopsychiatry** 1981;16(2):124–3

Eye tracking in patients with unipolar and bipolar affective disorders in remission. Iacono WG, et al. **J Abnorm Psychol** 1982 Feb; 91(1):35–44

Plasma GABA in affective illness. A preliminary investigation. Petty F, et al. **J Affective Disord** 1981 Dec;3(4):339–43

Clinical conferences: Management of depression in older people. **J Am Geriatr Soc** 1982 Mar;30(3):219–23

Plasma concentrations of tricyclic antidepressants in clinical practice. Hollister LE. **J Clin Psychiatry** 1982 Feb;43(2):66–9

A controlled comparison of trimipramine and amitriptyline. Kline NS. **J Clin Psychiatry** 1981 Mar;43(3):100–4

Viloxazine HCl in the treatment of endogenous depression: a standard (imipramine) controlled clinical study. McEvoy JP, et al. **J Clin Psychiatry** 1981 Mar;43(3):111–2

Maprotiline versus imipramine [letter] Rifkin A. **J Clin Psychiatry** 1981 Mar;43(3):122

Methodological problems in studies of depressive disorder: utility of the discontinuation design. Quitkin FM, et al. **J Clin Psychopharmacol** 1981 Sep;1(5):283–8

Combined use of trimipramine and phenelzine in depression. Zetin M. **J Nerv Ment Dis** 1982 Apr;170(4):246–7

Defective serotonin transport mechanism in platelets from endogenously depressed patients. Malmgren R, et al. **Life Sci** 1981 Dec 21; 29(25):2649–58

Recognition and management of depression in the elderly. Finlayson RE, et al. **Mayo Clin Proc** 1982 Feb;57(2):115–20

Comments on multicenter trials of antidepressant drugs. Hippius H, et al. **Mod Probl Pharmacopsychiatry** 1981;16:95–9

DESIPRAMINE

Lorazepam and desipramine serum concentration [letter] Rosenblatt JE. **Am J Psychiatry** 1982 Apr;139(4):536–7

A study on the effect of chlorpromazine and desipramine on the activity of some adrenal enzymes. Chan MY, et al. **Biochem Pharmacol** 1981 Dec 15;30(24):3365–7

Cyclic AMP response to norepinephrine in the limbic forebrain of male and female rats: effect of desipramine. Mishra R, et al. **Biochem Pharmacol** 1981 Nov 15;30(22):3126–8

The effect of long-term chlorpromazine and desipramine treatment o adrenal corticosterone, cyclic AMP, and cholesterol distribution in rats. Hung F, et al. **Clin Exp Pharmacol Physiol** 1981 Dec;8(6):567-74

Active metabolites of imipramine and desipramine in man. Potter WZ, et al. **Clin Pharmacol Ther** 1982 Mar;31(3):393-401

Desipramine-induced agranulocytosis. A case report. Hardin TC, et al. **Drug Intell Clin Pharm** 1982 Jan;16(1):62-3

Behavioural evidence for supersensitivity of postsynaptic dopamine receptors in the mesolimbic system after chronic administration of desipramine. Spyraki C, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2-3):195-206

Determination of 2-hydroxydesipramine by high-performance liquid chromatography. Wong SH, et al. **J Chromatogr** 1981 Nov 13; 226(1):147-54

High-affinity binding of [3H]desipramine to rat brain: a presynaptic marker for noradrenergic uptake sites. Rehavi M, et al. **J Neurochem** 1982 Apr;38(4):889-95

Cerebral pharmacokinetics of imipramine in rats after single and multiple dosages. Daniel W, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):209-13

3H-Noradrenaline and 3H-5-hydroxytryptamine release from rat brain slices and its presynaptic alpha-adrenergic modulation after long-term desipramine pretreatment. Schoffelmeer AN, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):173-80

3H-WB 4101 binding in the rat vas deferens. Effects of chronic treatments with desipramine and prazosin. Wetzel HW, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):187-92

Depression, antidepressants, and plasma DBH. Mathew RJ, et al. **Psychiatry Res** 1981 Dec;5(3):331-4

The effects of desmethylimipramine and lithium on human sperm function. Amsterdam JD, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):359-63

A comparison of plasma and serum levels of two tricyclic antidepressants: imipramine and desipramine. Saady JJ, et al. **Psychopharmacology (Berlin)** 1981;75(2):173-4

[Decrease of paradoxical sleep in the rat under tricyclic antidepressant: the role of collateral inhibition (author's transl)] Justafre JC, et al. **Rev Electroencephalogr Neurophysiol Clin** 1981 Nov;11(2):228-35 (Eng. Abstr.) (Fre)

DESOXYCORTICOSTERONE

Identification of 19-hydroxydeoxycorticosterone, 19-oxo-deoxycorticosterone, and 19-oic-deoxycorticosterone as products of deoxycorticosterone metabolism by rat adrenals. Gomez-Sanchez CE, et al. **Endocrinology** 1982 Feb;110(2):384-9

DEXTROAMPHETAMINE

Effects of d-amphetamine on urinary metabolites of dopamine and norepinephrine in hyperactive boys. Shekim WO, et al. **Am J Psychiatry** 1982 Apr;139(4):485-8

Long-term decreases in striatal dopamine, 3,4-dihydroxyphenylacetic acid, and homovanillic acid after a single injection of amphetamine in iprindole-treated rats: time course and time-dependent interactions with amfonelic acid. Steranka LR. **Brain Res** 1982 Feb 18;234(1):123-36

Opposed stages of continuous amphetamine administration: parallel alterations in motor stereotypies and in vivo spiroperidol accumulation. Ellison G, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):207-14

D-Amphetamine at low doses suppresses noradrenergic functions. Huang YH, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):187-95

Drug preferences in humans. Johanson CE, et al. **Fed Proc** 1982 Feb; 41(2):228-33

A trial of dextroamphetamine in patients with involutional agitated depression. Ward NG, et al. **J Clin Psychiatry** 1982 Jan;43(1):35-6

Unstimulated and amphetamine-stimulated release of endogenous noradrenaline and dopamine from rat brain in vivo. Philips SR, et al. **J Neurochem** 1982 Apr;38(4):1106-10

Differential involvement of dopamine-containing tracts in 5-hydroxytryptamine-dependent behaviours caused by amphetamine in large doses. Andrews CD, et al. **Neuropharmacology** 1982 Jan; 21(1):63-8

Elevation of Met5-enkephalin and beta-endorphin hypothalamic content in rats receiving anorectic drugs: differences between D-fenfluramine and D-amphetamine. Harsing LG Jr, et al. **Neuropharmacology** 1982 Feb;21(2):141-5

Spinal modulation of acoustic startle: opposite effects of clonidine and d-amphetamine. Davis M, et al. **Psychopharmacology (Berlin)** 1981; 75(3):219-25

DIAZEPAM

Consumption of diazepam, nitrazepam and barbiturates in 5 large hospitals in Prague by defined daily doses per bed/day. Ivančová J, et al. **Act Nerv Super (Praha)** 1981;23(4):267-9

Diazepam adsorption to infusion sets and plastic syringes. Winsnes M, et al. **Acta Anaesthesiol Scand** 1981 Apr;25(2):93-6

Pharmacokinetics of diazepam administered rectally in geriatric patients: comparison of suppositories with rectal tubes in a cross-over study. Viukari M, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Jul; 49(1):59-64

The use of diazepam and of cocaine in combination with other drugs by Los Angeles County probationers. Budd RD. **Am J Drug Alcohol Abuse** 1981;8(2):249-55

Diazepam in schizophrenia: a preliminary double-blind trial. Jimerson DC, et al. **Am J Psychiatry** 1982 Apr;139(4):489-91

Pharmacokinetics of diazepam in the dog. Löscher W, et al. **Arch Int Pharmacodyn Ther** 1981 Dec;254(2):180-95

Biliary excretion of diazepam in rats: influence of the route of administration and dosage. Phillips R, et al. **Arch Int Pharmacodyn Ther** 1981;253(2):180-91

Sedation for upper gastrointestinal endoscopy [letter] Bardhan KD. **Br J Anaesth** 1981 Dec;53(12):1368

Effect of oral diazepam on lower oesophageal sphincter pressure. Cotton BR, et al. **Br J Anaesth** 1981 Nov;53(11):1147-50

Diazepam, propranolol and their combination in the management of chronic anxiety. Hallstrom C, et al. **Br J Psychiatry** 1981 Nov; 139:417-21

Diazepam and lidocaine plasma protein binding in renal disease. Grossman SH, et al. **Clin Pharmacol Ther** 1982 Mar;31(3):350-7

Steady-state plasma desmethyldiazepam during long-term clorazepate use: effects of antacids. Shader RI, et al. **Clin Pharmacol Ther** 1982 Feb;31(2):180-3

Diazepam dependency and withdrawal. Ayd FJ Jr. **Curr Psychiatr Ther** 1981;20:263-73

Pharmacokinetics of N-desmethyldiazepam after a single oral dose of clorazepate: the effect of smoking. Norman TR, et al. **Eur J Clin Pharmacol** 1981;21(3):229-33

Modification of diazepam's antileptazol activity by endogenous tryptophan-like compounds. Vellucci SV, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):255-9

3H-Diazepam binding sites in Roman high- and low-avoidance rats. Gentsch C, et al. **Experientia** 1981 Dec 15;37(12):1315-6

Drug preferences in humans. Johanson CE, et al. **Fed Proc** 1982 Feb; 41(2):228-33

The use of psychopharmacology to study reciprocal influences in parent-child interaction. Barkley RA. **J Abnorm Child Psychol** 1981 Sep;9(3):303-10

A safe method for repeatedly immobilizing seals. Geraci JR, et al. **J Am Vet Med Assoc** 1981 Dec 1;179(11):1192-3

A rapid procedure for the screening and quantitation of barbiturates, diazepam, desmethyldiazepam and methaqualone. McCurdy HH, et al. **J Anal Toxicol** 1981 Sep-Oct;5(5):253-7

Sedative-hypnotic tolerance testing and withdrawal comparing diazepam to barbiturates. Perry PJ, et al. **J Clin Psychopharmacol** 1981 Sep; 1(5):289-96

Assessment of pharmacodynamics of a new 'controlled release' form of diazepam (Valium CR Roche) by quantitative EEG and psychometric analysis in neurotic subjects. Saletu B, et al. **J Int Med Res** 1981; 9(6):408-33

[3H]Diazepam displacing activity in human cerebrospinal fluid. Kuhn W, et al. **J Neurochem** 1981 Oct;37(4):1045-7

Etomidate stereospecifically stimulates forebrain, but not cerebellar, 3H-diazepam binding. Ashton D, et al. **Life Sci** 1981 Dec 21; 29(25):2631-6

Impairment of diazepam metabolism by low-dose estrogen-containing oral-contraceptive steroids. Abernethy DR, et al. **N Engl J Med** 1982 Apr 1;306(13):791-2

The effects of acute administration of diazepam on the binding of [3H]-diazepam and [3H]-gaba to rat cortical membranes. Coupet J, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):965-8

Effect of parachlorophenylalanine on the incidence of abnormal behaviors observed following diazepam withdrawal. Suzuki T, et al. **Prog Neuropsychopharmacol** 1981;5(4):415-7

A dose response study of the hypnotic effectiveness of alprazolam and diazepam in normal subjects. Bonnet MH, et al. **Psychopharmacology (Berlin)** 1981;75(3):258-61

Two opposite effects of diazepam on fear by differential training in the CER-paradigm. Haug T, et al. **Psychopharmacology (Berlin)** 1981; 75(2):110-3

Anticonvulsant doses of inosine result in brain levels sufficient to inhibit [3H] diazepam binding. Marangos PJ, et al. **Psychopharmacology (Berlin)** 1981;75(2):175-8

Effect of age and sex on disposition of desmethyldiazepam formed from its precursor clorazepate. Shader RI, et al. **Psychopharmacology (Berlin)** 1981;75(2):193-7

Differential inhibition by diazepam and nitrazepam of UDP-glucuronyltransferase activities in rats. del Villar E, et al. **Res Commun Chem Pathol Pharmacol** 1981 Sep;33(3):433-47

The use of valium as a form of social control. Koumjian K. **Soc Sci Med [E]** 1981 Aug;15(3):245-9

[Comparative study of the effects of diazepam and fentanyl on the blink reflex threshold in the normal, conscious human (preliminary study)] Dauthier C, et al. **Ann Anesthesiol Fr** 1981;22(4):317-21 (Eng. Abstr.)

(Fre)

[Diazepam (Diazemuls Vitrum) and vein damages (letter)] Drøsdal S, et al. **Tidsskr Nor Laegeforen** 1981 Sep 20;101(26):1477-8 (Nor)

[Binding of 3H-diazepam by cerebral cortex synaptic membranes in the rat during conditioned reflex elaboration] Korotkov KO, et al. **Biull Eksp Biol Med** 1981 Dec;92(12):695-6 (Eng. Abstr.) (Rus)

[Binding of 3H-serotonin, 3H-diazepam and lipid peroxidation in brain membranes] Libe ML, et al. **Biull Eksp Biol Med** 1981 Nov; 92(11):552-4 (Eng. Abstr.) (Rus)

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskiĭ Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) (Rus)

DIBENZAZEPINES

A suspected case of trimipramine-induced salivary adenitis. Ponte CD. **Drug Intell Clin Pharm** 1982 Mar;16(3):248-9

A controlled comparison of trimipramine and amitriptyline. Kline NS. **J Clin Psychiatry** 1981 Mar;43(3):100-4

Combined use of trimipramine and phenelzine in depression. Zetin M. **J Nerv Ment Dis** 1982 Apr;170(4):246-7

Serum concentration of pancreatic polypeptide after infusion of histamine and the effect of cimetidine, trimipramine, and atropine in man. Flaten O, et al. **Scand J Gastroenterol** 1981;16(8):989-91

Different synaptic location of mianserin and imipramine binding sites. Brunello N, et al. **Science** 1982 Feb 26;215(4536):1112-5

[Cloxazepine: neuropharmacological studies] Stefanova D. **Eksp Med Morfol** 1981;20(4):208-13 (Eng. Abstr.) (Bul)

[Agranulocytosis during treatment with mianserin (Tolvon)] Skallgård F. **Ugeskr Laeger** 1981 Nov 9;143(46):3057 (Eng. Abstr.) (Dan)

[Comparative results of the treatment of anxiety in the depressive syndrome with Tolvon, Vivalan and Alival] Ivanov V, et al. **Agressologie** 1981 Nov;22(D):29-30 (Fre)

[Antidepressant monotherapy: efficacy and tolerability of mianserin (Athymil)] Pringuey D, et al. **Ann Med Psychol (Paris)** 1981 Nov; 139(9):1003-14 (Fre)

[Analysis of controlled studies comparing mianserin and clomipramine (author's transl)] de Buck RP. **Encephale** 1981;7(4 Suppl):455-72 (Eng. Abstr.) (Fre)

[Mianserin, presynaptic receptor and biochemical model of depression of Tissot (author's transl)] Dereux JF. **Encephale** 1981; 7(4 Suppl):399-400 (Eng. Abstr.) (Fre)

[An open study of Mianserin (author's transl)] Lemperiere T, et al. **Encephale** 1981;7(4 Suppl):445-54 (Eng. Abstr.) (Fre)

[Mianserin: review and discussion of its double-blind studies versus nomifensine] Montgomery SA, et al. **Encephale** 1981; 7(4 Suppl):485-94 (Eng. Abstr.) (Fre)

[Agranulocytosis during treatment with mianserin (letter)] Lombrail P, et al. **Therapie** 1981 Sep-Oct;36(5):593-4 (Fre)

DIBENZOTHIEPINS

Further clinical experience with oxyprothepin-decanoate. Kalvach Z, et al. **Act Nerv Super (Praha)** 1981;23(4):271-2

Neuroleptics in neurotic anxiety. Boleloucky Z. **Agressologie** 1981 Nov; 22(D):15-7

Dothiepin, antianxiety effect in neurotic women. Boriová M, et al. **Agressologie** 1981 Nov;22(E):9-10

Anxiety in climax and its pharmacological treatment. Tondlova H, et al. **Agressologie** 1981 Nov;22(E):7-8

[Personality, antidepressant and neuroses] Boleloucký Z, et al. **Agressologie** 1981 Nov;22(E):3-5 (Fre)

[Comparison between the effectiveness of fluphenazine decanoate and oxyprothepin decanoate in schizophrenia (double-blind crossover study)] Balon R, et al. **Zh Nevropatol Psikhiatr** 1982;82(1):116-8 (Eng. Abstr.) (Rus)

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskiĭ Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) (Rus)

DIBENZOXAZEPINES

Physostigmine's use questioned for amoxapine overdose [letter] **Am J Hosp Pharm** 1981 Dec;38(12):1882, 1889

Case report of painful ejaculation as a side effect of amoxapine. Kulik FA, et al. **Am J Psychiatry** 1982 Feb;139(2):234-5

Case report of inhibition of ejaculation and retrograde ejaculation as side effects of amoxapine. Schwarcz G. **Am J Psychiatry** 1982 Feb; 139(2):233-4

The lipid-lowering profile in rodents. AZ-1355, a new dibenzoxazepine derivative. Wada S, et al. **Atherosclerosis** 1981 Nov-Dec; 40(3-4):263-71

Amoxapine (Asendin, Lederle Laboratories). Dugas JE, et al. **Drug Intell Clin Pharm** 1982 Mar;16(3):199-204 (34 ref.)

Amoxapine, an observation, and a perspective on MAOIs and their safety [editorial] Shader RI, et al. **J Clin Psychopharmacol** 1981 Sep; 1(5):263

DIETHYLAMINES

Toxicological testing of rats subjected to inhalation of diethylhydroxylamine, nitroethane, and diethylamine hydrogen sulfide. Heicklen J, et al. **Environ Res** 1981 Dec;26(2):258-73

DISCRIMINATION (PSYCHOLOGY)

Hallucinogens as discriminative stimuli: a comparison of 4-OMe DMT and 5-OMe DMT with their methylthio counterparts. Glennon RA, et al. **Life Sci** 1982 Feb 1;30(5):465-7

Selective blockade of the discriminative stimulus effects of pentobarbital in pigeons. Herling S, et al. **Psychopharmacology (Berlin)** 1981; 75(3):321-3

DISCRIMINATION LEARNING

Behavioral properties of psychoactive phenylisopropylamines in rats. Glennon RA, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):353-60

Phencyclidine discrimination in the pigeon using color tracking under second-order schedule. McMillan DE, et al. **J Exp Anal Behav** 1982 Jan;37(1):143-7

Multiple drug training as a method for increasing the specificity of the drug discrimination procedure. Overton DA. **J Pharmacol Exp Ther** 1982 Apr;221(1):165-72

Environmental enrichment to alleviate maze performance deficits in rats with microcephaly induced by x-irradiation. Shibagaki M, et al. **Physiol Behav** 1981 Nov;27(5):797-802

The role of dopaminergic mechanisms in the rat hippocampus for the consolidation in a brightness discrimination. Grecksch G, et al. **Psychopharmacology (Berlin)** 1981;75(2):165-8

A repeated test procedure to assess onset and duration of the cue properties of (-) delta 9-THC, (-) delta 8-THC-DMH and (+) delta 8-THC. Järbe TU, et al. **Psychopharmacology (Berlin)** 1981; 75(2):152-7

DOPA

Renal handling of dopa, dopamine, norepinephrine, and epinephrine in the dog. Ball SG, et al. **Am J Physiol** 1982 Jan;242(1):F56-62

The increase of cardiac beta 1-subtype of beta-adrenergic receptors in adult rats following neonatal 6-hydroxydopa treatment. Kajiyama H, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):75-7

Simultaneous determination of 3,4-dihydroxyphenylalanine, 5-hydroxytryptophan, dopamine, 4-hydroxy-3-methoxyphenylalanine, norepinephrine, 3,4-dihydroxyphenylacetic acid, homovanillic acid, serotonin, and 5-hydroxyindoleacetic acid in rat cerebrospinal fluid and brain by high-performance liquid chromatography with electrochemical detection. Wagner J, et al. **J Neurochem** 1982 May;38(5):1241-54

Use of liquid chromatography with electrochemistry to measure effects of varying intensities of white light on DOPA accumulation in rat retinas. Proll MA, et al. **Life Sci** 1982 Jan 4;30(1):11-9

[Spectrofluorometric determination of catecholamines and dihydroxyphenylalanine in 1 sample] Sominskiĭ VN, et al. **Lab Delo** 1982;(1):11-5 (Eng. Abstr.) (Rus)

DOPAMINE

Intestinal pharmacomanometry and glucose tolerance: two kinds of dopaminergic mechanisms in the human. Lechin F, et al. **Acta Gastroenterol Latinoam** 1981;11(2):247-59 (116 ref.)

Functional importance of nucleus accumbens noradrenaline in the rat. Svensson L, et al. **Acta Pharmacol Toxicol (Copenh)** 1982 Jan; 50(1):22-4

Interactions between GABA, dopamine, acetylcholine, and glutamate-containing neurons in the extrapyramidal and limbic systems. Bartholini G, et al. **Adv Biochem Psychopharmacol** 1981;30:119-28

Critical role of midbrain reticular formation in the expression of dopamine-mediated circling behaviour. Reavill C, et al. **Adv Biochem Psychopharmacol** 1981;30:187-204

Renal handling of dopa, dopamine, norepinephrine, and epinephrine in the dog. Ball SG, et al. **Am J Physiol** 1982 Jan;242(1):F56-62

Rapid fluctuations in plasma catecholamines in monkeys under undisturbed conditions. Hansen BC, et al. **Am J Physiol** 1982 Jan; 242(1):E40-6

Conditions for enhancement of renin release by isoproterenol, dopamine, and glucagon. Holdaas H, et al. **Am J Physiol** 1982 Mar; 242(3):F267-73

Neural and extraneural catecholamine production by rat kidneys. Stephenson RK, et al. **Am J Physiol** 1982 Mar;242(3):F261-6

Reduction of hypoxic ventilatory drive by dopamine. Ward DS, et al. **Anesth Analg (Cleve)** 1982 Apr;61(4):333-7

Comparison of dopamine and dobutamine following coronary artery bypass grafting. Salomon NW, et al. **Ann Thorac Surg** 1982 Jan; 33(1):48-54

Formation of 3H-dopamine and 3H-noradrenaline from 3H-tyrosine in the canine saphenous vein. Boels PJ, et al.

ch Int **Pharmacodyn Ther** 1981 Oct;253(2):315-16

ferences in the inhibitory effect of Cd2+, Mn2+ and Al3+ on the ptake of dopamine by synaptosomes from forebrain and from striatum f the rat. Lai JC, et al. **Biochem Pharmacol** 1981 Nov 15; 0(22):3123-5

zymology and subcellular localization of aldehyde oxidation in rat liver. Oxidation of 3,4-dihydroxyphenylacetaldehyde derived from dopamine o 3,4-dihydroxyphenylacetic acid. Tank AW, et al. **Biochem Pharmacol** 1981 Dec 15;30(24):3265-75

versible blockade of [3H]spiperone- but not [3H]dopamine-labeled dopamine receptors with phenoxybenzamine. Titeler M. **Biochem Pharmacol** 1981 Nov 15;30(22):3031-7

strogens, dopamine and mood [letter] Cookson J. **Br J Psychiatry** 1981 Oct;139:365-6

itive and negative schizophrenia symptoms and the role of dopamine. Crow TJ. **Br J Psychiatry** 1981 Sep;139:251-4

idence for dopamine autoreceptors controlling dopamine synthesis in the substantia nigra. Argiolas A, et al. **Brain Res** 1982 Feb 18; 234(1):177-81

perature regulation and dopaminergic systems in the brain: does the substantia nigra play a role? Brown SJ, et al. **Brain Res** 1982 Feb 25, 234(2):275-86

euronal localization of dopamine-sensitive adenylate cyclase within the rat olfactory tubercle. Church AC, et al. **Brain Res** 1982 Feb 25; 234(2):369-76

rebral circulatory response to hypercapnia: effects of lesions of central dopaminergic and serotoninergic neuron systems. Dahlgren N, et al. **Brain Res** 1981 Dec 28;230(1-2):221-33

CTH 1-24 and lysine vasopressin selectively activate dopamine synthesis in frontal cortex. Delanoy RL, et al. **Brain Res** 1982 Jan 7; 231(1):117-29

ltered neuronal responsiveness to biogenic amines in rat cerebral cortex after serotonin denervation or depletion. Ferron A, et al. **Brain Res** 1982 Jan 7;231(1):93-108

haracterization of high affinity dopamine uptake into the dopamine neurons of the hypothalamus. George SR, et al. **Brain Res** 1982 Feb 25;234(2):339-55

Evidence for dopamine as a transmitter in dorsal hippocampus. Ishikawa K, et al. **Brain Res** 1982 Jan 28;232(1):222-6

mygdalar noradrenergic and dopaminergic mechanisms in the regulation of hunger and thirst-motivated behavior. Lénárd L, et al. **Brain Res** 1982 Feb 4;233(1):115-32

volvement of GABA in the feedback action of estradiol on gonadotropin and prolactin release: hypothalamic GABA and catecholamine turnover rates. Mansky T, et al. **Brain Res** 1982 Jan 14;231(2):353-64

Long-term decreases in striatal dopamine, 3,4-dihydroxyphenylacetic acid, and homovanillic acid after a single injection of amphetamine in iprindole-treated rats: time course and time-dependent interactions with amfonelic acid. Steranka LR. **Brain Res** 1982 Feb 18;234(1):123-36

Effect of des-Tyr1-gamma-endorphin and des-Tyr1-alpha-endorphin on alpha-MPT-induced catecholamine disappearance in rat brain nuclei: a dose—response study. Versteeg DH, et al. **Brain Res** 1982 Jan 14; 231(2):343-51

Dopamine blocks carrier-mediated release of GABA from retinal horizontal cells. Yazulla S, et al. **Brain Res** 1982 Feb 4;233(1):211-5

Altered hypothalamic dopamine depletion rate and LHRH content in acyclic hamsters. Kumar MS, et al. **Brain Res Bull** 1982 Jan; 8(1):33-6

Aging of tuberoinfundibular (A-12) dopamine neurons in the C57Bl/6N male mouse. Selemon LD, et al. **Brain Res Bull** 1981 Nov; 7(5):585-94

The effects of catecholamines on hemorrhagic shock in dogs. Sakahira K, et al. **Bull Tokyo Med Dent Univ** 1981 Dec;28(4):125-34

Electrophysiological and mechanical studies of frog heart adrenoceptor stimulation by epinine. Soustre H, et al. **Cardiovasc Res** 1981 Dec; 15(12):700-10

Inhibition of reverse transcriptase by tyrosinase generated quinones related to levodopa and dopamine. Wick MM, et al. **Chem Biol Interact** 1981 Dec;38(1):99-107

Effect of inhibition of prostaglandin synthesis on urinary free dopamine excretion in women. Güllner HG, et al. **Clin Sci** 1982 Feb; 62(2):209-13

Role of dopamine in the regulation of blood pressure and the renin—angiotensin—aldosterone system in conscious rats. Kondo K, et al. **Clin Sci [Suppl]** 1981 Dec;61(7):235s-237s

Effects of age on dopaminergic supersensitivity induced by chronic fluphenazine. Misra CH, et al. **Commun Psychopharmacol** 1980; 4(5):411-5

Modification of the drug talking behavior in rats by interference in the metabolism of 5-hydroxytryptamine and catecholamines. Fuchs V, et al. **Drug Alcohol Depend** 1981 Nov;8(3):235-44

The decrease in hypothalamic dopamine secretion induced by suckling: comparison of voltammetric and radioisotopic methods of measurement. Plotsky PM, et al. **Endocrinology** 1982 Mar;110(3):691-6

Rat prolactin and hypothalamic catecholamine nerve terminal systems. Evidence for rapid and discrete increases in dopamine and noradrenaline turnover in the hypophysectomized male rat. Andersson K, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):261-5

Stereoselectivity of presynaptic autoreceptors modulating dopamine release. Arbilla S, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):345-51

The effect of some anti-epilepsy drugs on enhancement of the monoamine-mediated behavioural responses following the administration of electroconvulsive shocks to rats. Bhavsar VH, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):243-7

In vivo electrochemical detection of catechols in several dopaminergic brain regions of anaesthetized rats. Buda M, et al. **Eur J Pharmacol** 1981 Jul 17;73(1):61-8

Benzodiazepines suppress the light response of retinal dopaminergic neurons in vivo. Kamp CW, et al. **Eur J Pharmacol** 1982 Feb 5; 77(4):343-6

Possible involvement of nigrostriatal dopamine system in the inhibition of thyrotropin secretion in the rat. Männistö P, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):403-9

Dopaminergic mechanisms in diet-induced thermogenesis and brown adipose tissue metabolism. Rothwell NJ, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):45-8

Dopamine neurones of the ventral tegmentum project to both medial and lateral habenula. Some implications for habenular function. Phillipson OT, et al. **Exp Brain Res** 1982;45(1-2):89-94

Dopamine-containing cells in rabbit nodose ganglia. Kojima H, et al. **Experientia** 1981 Dec 15;37(12):1332-3

Comparative effects of short- and long-term treatment with neuroleptics on behavioural activity as well as dopamine turnover in striatum. Rastogi RB, et al. **Gen Pharmacol** 1982;13(1):35-40

Effect of metoclopramide in guinea-pig ileum longitudinal muscle: evidence against dopamine-mediation. Zar MA, et al. **Gut** 1982 Jan; 23(1):66-70

Glial uptake of monoamines in primary cultures of rat median raphe nucleus and cerebellum. A combined monoamine fluorescence and glial fibrillary acidic protein immunofluorescence study. Liesi P, et al. **Histochemistry** 1981;73(2):239-50

Synaptic organization of the dopaminergic neurons in the retina of the cynomolgus monkey. Holmgren I. **Invest Ophthalmol Vis Sci** 1982 Jan; 22(1):8-24

Gas chromatographic method for the simultaneous determination of dopamine and norepinephrine metabolites. Chauhan MS, et al. **J Chromatogr** 1982 Feb 12;227(2):323-30

Future directions in dopaminergic nervous system and dopaminergic agonists. Cannon JG, et al. **J Med Chem** 1981 Oct;24(10):1113-8 (66 ref.)

Inhibitory effects of ascorbic acid on the binding of [3H]dopamine antagonists to neostriatal membrane preparations: relationship to lipid peroxidation. Heikkila RE, et al. **J Neurochem** 1982 Apr; 38(4):1000-6

Monoamine oxidase-catalyzed metabolism of 3,4-dihydroxyphenylethylamine in the dopaminergic synaptosomes from rat corpus striatum. Katz IR. **J Neurochem** 1982 Mar; 38(3):859-62

Catabolism of endogenous dopamine in peripheral tissues: is there an independent role for dopamine in peripheral neurotransmission? Lacković Z, et al. **J Neurochem** 1982 May;38(5):1453-8

The effects of chronic manganese chloride treatment expressed as age-dependent, transient changes in rat brain synaptosomal uptake of amines. Lai JC, et al. **J Neurochem** 1982 Mar;38(3):844-7

Biochemical evidence for alteration of neostriatal dopaminergic function by 5,7-dihydroxytryptamine. Liston DR, et al. **J Neurochem** 1982 May; 38(5):1329-35

Postmortem stability of dopamine-sensitive adenylate cyclase, guanylate cyclase, ATPase, and GTPase in rat striatum. Nicol SE, et al. **J Neurochem** 1981 Dec;37(6):1535-9

Unstimulated and amphetamine-stimulated release of endogenous noradrenaline and dopamine from rat brain in vivo. Philips SR, et al. **J Neurochem** 1982 Apr;38(4):1106-10

On the significance of endogenous 3-methoxytyramine for the effects of centrally acting drugs on dopamine release in the rat brain. Westerink BH, et al. **J Neurochem** 1982 Mar;38(3):680-6

Neuronal cell surfaces: distinctive glycoproteins of cultured adrenergic and cholinergic sympathetic neurons. Braun SJ, et al. **J Neurosci** 1981 Dec;1(12):1397-406

Collateralization of monoamine neurons: mesotelencephalic dopamine projections to caudate, septum, and frontal cortex. Fallon JH. **J Neurosci** 1981 Dec;1(12):1361-8

Dopamine and [D-ALA2, D-Leu5]enkephalin inhibit the electrically stimulated neurohypophyseal release of vasopressin in vitro: evidence for calcium-dependent opiate action. Lightman SL, et al. **J Neurosci** 1982 Jan;2(1):78-81

Specific uptake of norepinephrine and dopamine by homogenates of rat cerebral cortex after locus ceruleus lesion. Logan WJ, et al. **J Neurosci** 1982 Mar;2(3):394-8

Realization of a new multifiber electrochemical device allowing continuous in vivo measurements of neuromediators. Forni C. **J Neurosci Methods** 1982 Jan;5(1-2):167-71

Influence of dietary zinc on rat brain catecholamines. Wallwork JC, et al. **J Nutr** 1982 Mar;112(3):514-9

Gangrene in a neonate following dopamine therapy. Maggi JC, et al. **J Pediatr** 1982 Feb;100(2):323-5

Chronic treatment with haloperidol or fluphenazine decanoate: regional effects on dopamine and serotonin metabolism in primate brain. Bacopoulos NG, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):22-8

Effect of delta9-tetrahydrocannabinol on the synthesis of dopamine and norepinephrine in mouse brain synaptosomes. Bloom AS. **J Pharmacol Exp Ther** 1982 Apr;221(1):97-103

Differential dose- and time-dependent effects of molindone on dopamine neurons of rat brain: mediation by irreversible inhibition of monoamine oxidase. Meller E, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):609-15

gamma-Aminobutyric acid (GABA) receptor stimulation. III. Effect of progabide (SL 76002) on norepinephrine, dopamine and 5-hydroxytryptamine turnover in rat brain areas. Scatton B, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):678-88

Catastrophe theory of dopaminergic transmission: a revised dopamine hypothesis of schizophrenia. King R, et al. **J Theor Biol** 1981 Oct 21; 92(4):373-400

Compared efficacy of dobutamine and dopamine in association with calcium chloride on termination of cardiopulmonary bypass. d'Hollander A, et al. **J Thorac Cardiovasc Surg** 1982 Feb; 83(2):264-71

Dopaminergic inhibition from substantia nigra of caudate neurons activated by cortical stimulation. Fujimoto S, et al. **Jpn J Pharmacol** 1981 Dec;31(6):1037-42

Acute changes in the state of dopamine receptors: in vitro monitoring with 3H-dopamine. Bacopoulos NG. **Life Sci** 1981 Dec 7; 29(23):2407-14

The convulsive effects of dopamine sulfate conjugates in rat brain. Buu NT, et al. **Life Sci** 1981 Nov 30;29(22):2311-6

Biphasic influence of a 8 alpha-amino ergoline, CU 32-085, on striatal dopamine synthesis and turnover in vivo in the rat. Enz A. **Life Sci** 1981 Nov 23;29(21):2227-34

Forebrain catecholamine concentrations in the rat after neocortical and hippocampal lesions. Woodruff ML, et al. **Life Sci** 1981 Dec 21; 29(25):2603-7

Dopamine- and serotonin-sensitive adenylate cyclase in the gill of Aplysia californica. Weiss S, et al. **Mol Pharmacol** 1981 Nov;20(3):592-7

Unique response to antipsychotic drugs is due to absence of terminal autoreceptors in mesocortical dopamine neurones. Bannon MJ, et al. **Nature** 1982 Apr 1;296(5856):444-6

Non-dopaminergic fibres may regulate dopamine-sensitive adenylate cyclase in the prefrontal cortex and nucleus accumbens. Tassin JP, et al. **Nature** 1982 Feb 25;295(5851):696-8

Motor effects following application of putative excitatory amino acid antagonists to the region of the mesencephalic dopamine cell bodies in the rat. Dawbarn D, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(2):100-4

Analysis of the effects of dopamine and noradrenaline in relation to the proposed postsynaptic dopamine receptor in rat vas deferens. Langeloh A, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb; 318(3):202-9

Effects of piracetam on the central dopaminergic transmission. Rägo LK, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(1):36-7

Tissue specificity of dopamine effects on brain ATPases. Antonelli de Gómez de Lima M, et al. **Neurochem Res** 1981 Sep;6(9):969-77

Central effects of dopamine and bromocriptine on vasopressin release and blood pressure. Kimura T, et al. **Neuroendocrinology** 1981 Dec; 33(6):347-51

Neuroleptic malignant syndrome caused by dopamine depleting drugs [letter] Login IS, et al. **Neurology (NY)** 1982 Feb;32(2):218-9

Antiestrogen-induced alterations of hypothalamic dopamine and norepinephrine levels in the female rat. Baksi SN, et al. **Neuropharmacology** 1981 Dec;20(12A):1163-7

The use of dopamine agonists in the treatment of schizophrenia. Corsini GU, et al. **Neuropharmacology** 1981 Dec;20(12B):1309-13

Repeated administration of triiodothyronine (T3) to rats enhances nigrostriatal and mesolimbic dopaminergic behavioural responses. Heal DJ, et al. **Neuropharmacology** 1982 Feb;21(2):159-62

Correlation between the rate of avoidance conditioning and the brain catecholamine level in rats. Saul'skaya NB. **Neurosci Behav Physiol** 1981 May-Jun;11(3):221-6

Differential effects of certain dopaminergic drugs on the striatal concentration of dopamine metabolites, with special reference to 3-methoxytramine. Ponzio F, et al. **Neurosci Lett** 1981 Nov 18; 27(1):61-7

Involvement of the thalamus in the reciprocal regulation of the two nigrostriatal dopaminergic pathways. Chéramy A, et al. **Neuroscience** 1981;6(12):2657-68

Origin, course and termination of dopaminergic substantia nigra neurons projecting to the amygdaloid complex in the cat. Meibach RC, et al. **Neuroscience** 1981;6(11):2159-71

Dopaminergic dendrites in the pars reticulata of the rat substantia nigra and their striatal input. Combined immunocytochemical localization of tyrosine hydroxylase and anterograde degeneration. Wassef M, et al. **Neuroscience** 1981;6(11):2125-39

The influence of ingested aluminum upon norepinephrine and dopamine levels in the rat brain. Wenk GL, et al. **Neurotoxicology (Park Forest II)** 1981 Oct;2(2):347-53

Effect of an amnesic dose of reserpine, syrosingopine or guanethidine on the levels of whole brain dopamine and norepinephrine in the mouse. Brown OM, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):911-4

Measurement of metabolites of dopamine and 5-hydroxytryptamine in cerebroventricular perfusates of unanesthetized, freely-moving rats: selective effects of drugs. Nielsen JA, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):131-7

Infant rat hyperactivity elicited by home cage bedding is unaffected by neonatal telencephalic dopamine or norepinephrine depletion. Pappas BA, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):151-4

Substituted dopamine quinazolones as potent antiparkinsonian agents. Kumar P, et al. **Pharmazie** 1981 Nov;36(11):780

Effects of nootropic drugs on dopaminergic systems in the CNS. Westermann KH, et al. **Pol J Pharmacol Pharm** 1981;33(4):431-6

Role of the dopaminergic system in luteinizing hormone release and ovulation in the hen. Johnson PA, et al. **Poult Sci** 1981 Nov; 60(11):2551-6

Isolated horizontal cells from carp retina demonstrate dopamine-dependent accumulation of cyclic AMP. Van Buskirk R, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7825-9

Phenothiazine biphasic effect on dopamine concentrations in the basal ganglia of subhuman primates. Bird ED, et al. **Psychiatry Res** 1982 Feb;6(1):1-6

A comparison of some behavioural effects of amphetamine and electrical brain stimulation of the mesolimbic dopamine system in rats. D'Mello GD. **Psychopharmacology (Berlin)** 1981;75(2):184-92

Differential reversal of various dopamine antagonists by anticholinergics in Sidman avoidance: possible relationship to adrenergic blockade. Liebman JM, et al. **Psychopharmacology (Berlin)** 1981;75(3):248-53

Differential inhibitory effects of ascorbic acid on the binding of dopamine agonists and antagonists to neostriatal membrane preparations: correlations with behavioral effects. Heikkila RE, et al. **Res Commun Chem Pathol Pharmacol** 1981 Dec;34(3):409-21

Evidence for the existence of a dopamine-sensitive adenylate cyclase in chick optic tectum. Nisticò G, et al. **Res Commun Chem Pathol Pharmacol** 1981 Sep;33(3):387-93

Evidence for endogenous dopaminergic control of GH release in man. Hanew K, et al. **Tohoku J Exp Med** 1981 Sep;135(1):103-8

[Rate of cerebral dopamine synthesis in rats] Vamvakides A. **Agressologie** 1981;22(3):117-28 (Eng. Abstr.) (Fre)

[Biochemical analysis of dopaminergic nerve terminals of post-mortem brain from schizophrenic patients (author's transl)] Toru M, et al. **Seishin Shinkeigaku Zasshi** 1981;83(7):430-47 (Eng. Abstr.) (Jpn)

[Effect of dopamine on the contractility of isolated blood vessels of the human placenta] Urban J, et al. **Ginekol Pol** 1981;52(9):757-62 (Eng. Abstr.) (Pol)

[Effect of intracaudate administration of kainic acid on the activity of the dopaminergic system] Zharkovskiĭ AM, et al. **Fiziol Zh SSSR** 1981 Nov;67(11):1606-10 (Eng. Abstr.) (Rus)

[Various features of dopamine metabolism in schizophrenia] Anokhina IP, et al. **Zh Nevropatol Psikhiatr** 1981;81(9):1343-7 (Eng. Abstr.) (Rus)

[Ligand-dopaminergic receptor bond in the guinea pig bladder] Idoate Tomás C, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):123-4 (Spa)

[Respiratory effects of intracerebroventricular dopamine in the rat] Mediavilla A, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):73-6 (Spa)

DOPAMINE BETA-HYDROXYLASE

Plasma dopamine-beta-hydroxylase activity during labour in women. Wasilewska E, et al. **Acta Physiol Pol** 1981;32(4):399-405

Biochemical differences in children with conduct disorder socialized and undersocialized. Rogeness GA, et al. **Am J Psychiatry** 1982 Mar; 139(3):307-11

Dopamine beta-hydroxylase: activity and inhibition in the presence of beta-substituted phenethylamines. Klinman JP, et al. **Biochemistry** 1982 Jan 5;21(1):67-75

Purification and characterization of avian dopamine beta-hydroxylase. Long RA, et al. **Biochemistry** 1981 Dec 22;20(26):7423-31

Plasma copper and dopamine-beta-hydroxylase in schizophrenia. Baron M, et al. **Biol Psychiatry** 1982 Jan;17(1):115-20

Oxygen dependence of dopamine-beta-hydoxylase activity and lactate metabolism in synaptosomes from rat brain. Katz IR. **Brain Res** 1982 Jan 14;231(2):399-409

Nitriphenol compound induces Ca-dependent exocytotic secretion of catecholamines by a direct effect on the plasma membranes of the adrenal medullary cells. Sorimachi M, et al. **Brain Res** 1982 Jan 28; 232(1):242-6

Assay for dopamine beta-hydroxylase in rat serum and adrenal medulla by high-performance liquid chromatography with fluorescence detection. Nohta H, et al. **J Chromatogr** 1982 Feb 12;227(2):415-22

Dopamine beta-hydroxylase and other glycoproteins from the soluble content and the membranes of adrenal chromaffin granules: isolation and carbohydrate analysis. Fischer-Colbrie R, et al. **J Neurochem** 1982 Mar;38(3):725-32

Immunochemical evidence for exocytosis in isolated chromaffin cells after stimulation with depolarizing agents. Wildmann J, et al. **J Neuroimmunol** 1981 Sep;1(3):353-64

Catecholamine and dopamine-beta-hydroxylase in anxiety. Mathew RJ, et al. **J Psychosom Res** 1981;25(6):499-504

Radioimmunoassay and immunotitration of human serum dopamine beta-hydroxylase. Dunnette J, et al. **Methods Enzymol** 1981; 74 Pt C:370-80

Effects of aging on the activity of hypothalamic dopamine-beta-hydroxylase during various stages of the estrous cycle in C57BL/6 mice. Banerji TK, et al. **Neuroendocrinology** 1982 Jan; 34(1):14-9

Depression, antidepressants, and plasma DBH. Mathew RJ, et al. **Psychiatry Res** 1981 Dec;5(3):331-4

DOXEPIN

Solubility and ionization characteristics of doxepin and desmethyldoxepin. Embil K, et al. **J Pharm Sci** 1982 Feb;71(2):191-3

DRUG EVALUATION

Guidelines for the evaluation of drugs in the elderly neuropsychiatric patient (demented and non-demented). **Pharmacopsychiatria** 1981 Nov; 14(6):217-22

DRUG INTERACTIONS

Digitalis toxicity mistaken for jaundice. Dickstein ES. **Geriatrics** 1982 Apr;37(4):133, 137-8

Drug interactions at excretory mechanisms. Offerhaus L. **Pharmacol Ther** 1981;15(1):69-78 (64 ref.)

DRUG SCREENING

[Predicted pharmacology of an antidepressant] Pinder RM. **Encephale** (Fre) 1981;7(4 Suppl):371-80 (Eng. Abstr.)

ELECTROCONVULSIVE THERAPY

Lithium continuation therapy following electroconvulsive therapy. Coppen A, et al. **Br J Psychiatry** 1981 Oct;139:284-7

Electroconvulsive shock results in a functional activation of endorphin systems. Holaday JW, et al. **Mod Probl Pharmacopsychiatry** 1981; 17:142-57

ELECTROENCEPHALOGRAPHY

EEG changes in the limbic system after the administration of leu5-enkephalin. Herink J, et al. **Act Nerv Super (Praha)** 1981; 23(4):290-2

An electroencephalographic study of 4-aminopyridine. Sia RL, et al. **Anesth Analg (Cleve)** 1982 Apr;61(4):354-7

EEG spectral analysis in vital depression: ultradian cycles. Lange H. **Biol Psychiatry** 1982 Jan;17(1):3-21

A reliable multichannel commutator for making electrical contact with conscious, freely moving rats. Andrews CD, et al. **J Neurosci Methods** 1982 Jan;5(1-2):73-6

Effect of serotonin injected into the amygdala on conditioned and unconditioned food reflexes and the EEG in cats. Gasanov GG, et al. **Neurosci Behav Physiol** 1981 May-Jun;11(3):207-12

Inverse relationship between onset and duration of EEG effects of six peripherally administered peptides. Miller LH, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):845-8

Quantitative EEG and behavioral effects in volunteers of a new benzodiazepine (SAS 643) in relation to drug plasma concentration. Sannita WG, et al. **Ther Drug Monit** 1981;3(4):341-9

[Quantitative EEG in depression (author's transl)] Badr G, et al. (Fre) **Encephale** 1981;7(4 Suppl):421-7 (Eng. Abstr.)

ELECTROLYTES

Divalent cation, ATP-dependent [3H]leu-enkephalin uptake by synaptic vesicle fraction isolated from bovine caudate nucleus. Takeda M, et al. **Brain Res** 1982 Feb 25;234(2):319-26

Neurohumoral control of ileal electrolyte transport. II. Neurotensin and substance P. Kachur JF, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):456-63

Lithium delays biochemical circadian rhythms in rats. McEachron DL, et al. **Neuropsychobiology** 1982 Jan-Feb;8(1):12-29

Lithium-induced polydipsia in birds: a comparative study and analysis of electrolyte excretion. Hardy WT, et al. **Physiol Behav** 1981 Oct; 27(4):575-83

ELECTROSHOCK

The effect of some anti-epilepsy drugs on enhancement of the monoamine-mediated behavioural responses following the administration of electroconvulsive shocks to rats. Bhavsar VH, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):243-7

Enhancement of responsiveness of the central serotonergic system and serotonin-2 receptor density in rat frontal cortex by electroconvulsive treatment. Vetulani J, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):81-5

Electroconvulsive shock and reserpine: effects on beta-adrenergic receptors in rat brain. Kellar KJ, et al. **J Neurochem** 1981 Oct; 37(4):830-6

Chronic electroconvulsive shock and chronic haloperidol administration are not additive in effects on dopamine receptors. Globus M, et al. **Neuropharmacology** 1981 Nov;20(11):1125-8

EMOTIONS

The effects of imipramine on socio-emotional and alimentary motivated behavior in dogs. Zagrodzka J, et al. **Acta Neurobiol Exp (Warsz)** 1981; 41(4):363-72

Drug preferences in humans. Johanson CE, et al. **Fed Proc** 1982 Feb; 41(2):228-33

[Effects of afloqualone, a new centrally acting muscle relaxant, on DRL response and CER in rats (author's transl)] Yamamura M, et al. (Jpn) **Nippon Yakurigaku Zasshi** 1981 Oct;78(4):381-92 (Eng. Abstr.)

[Characteristics of the psychoemotional state of children undergoing dental treatment] Solov'ev MM, et al. **Stomatologiia (Mosk)** 1982 (Rus) Jan-Feb;61(1):77-82 (Eng. Abstr.)

[Learning in rats with differing emotional responsiveness and its relation to brain monoamines] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1981 (Rus) Nov-Dec;31(6):1238-46 (Eng. Abstr.)

[Psychological component of human stress (author's transl)] Vargas Fernández L. **Rev Med Chil** 1981 May;109(5):441-51 (Eng. Abstr.) (Spa)

ENDORPHINS

EEG changes in the limbic system after the administration of leu5-enkephalin. Herink J, et al. **Act Nerv Super (Praha)** 1981; 23(4):290-2

Physiological role of endorphins in neuroendocrinology. Dupont A, et al. **Acta Physiol Pol** 1981;32(5 Suppl 23):37-57 (45 ref.)

Inhibition of salivary and lacrimal secretion by an enkephalin analogue [letter] Sullivan SN. **Am J Psychiatry** 1982 Mar;139(3):385-6

Endorphins and behavior. Bolles RC, et al. **Annu Rev Psychol** 1982; 33:87-101

Identification of the octapeptide [Met]enkephalin -Arg6-Gly7-Leu8 in extracts of bovine adrenal medulla. Kilpatrick DL, et al. **Biochem Biophys Res Commun** 1981 Nov 30;103(2):698-705

Solution conformations of the pituitary opioid peptide dynorphin-(1-13). Maroun R, et al. **Biochem Biophys Res Commun** 1981 Nov 30; 103(2):442-6

Acetylated and nonacetylated forms of beta-endorphin in rat brain and pituitary. Weber E, et al. **Biochem Biophys Res Commun** 1981 Dec 15; 103(3):982-9

Colocalization of alpha-neo-endorphin and dynorphin immunoreactivity in hypothalamic neurons. Weber E, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):951-8

Fast-atom-bombardment mass spectra of enkephalins. Barber M, et al. **Biochem J** 1981 Aug 1;197(2):401-4

Effects of metenkephalin on the formation and fixation of defensive temporal associations and on the incorporation of C14-leucine in brain proteins of the rat. Kruglikov RI, et al. **Biol Bull Acad Sci USSR** 1980 Sep-Oct;7(5):432-4

The treatment of schizophrenic psychoses with gamma-type endorphins. van Praag HM, et al. **Biol Psychiatry** 1982 Jan;17(1):83-98

Neostriatal enkephalin-immunoreactive neurones project to the globus pallidus. Del Fiacco M, et al. **Brain Res** 1982 Jan 7;231(1):1-17

Immunoreactive dynorphin in human brain and pituitary. Gramsch C, et al. **Brain Res** 1982 Feb 4;233(1):65-74

Immunocytochemical localization of beta-endorphin (lipotropin C-fragment) in the developing rat spinal cord and hypothalamus. Haynes LW, et al. **Brain Res** 1982 Jan 28;232(1):115-28

Beta-endorphin concentrations in serum, hypothalamus and central gray of hypophysectomized and mediobasal hypothalamus lesioned rats. Kerdelhué B, et al. **Brain Res** 1982 Jan 7;231(1):85-91

The actions of neuropeptides on dorsal horn neurons in the rat spinal cord slice preparation: an intracellular study. Murase K, et al. **Brain Res** 1982 Feb 18;234(1):170-6

Divalent cation, ATP-dependent [3H]leu-enkephalin uptake by synaptic vesicle fraction isolated from bovine caudate nucleus. Takeda M, et al. **Brain Res** 1982 Feb 25;234(2):319-26

Analgesic dipeptide, kyotorphin (Tyr-Arg), is highly concentrated in the synaptosomal fraction of the rat brain. Ueda H, et al. **Brain Res** 1982 Jan 7;231(1):222-4

Regional distribution of alpha- and gamma-type endorphins in rat brain. Verhoef J, et al. **Brain Res** 1982 Jan 14;231(2):454-60

Effect of des-Tyr1-gamma-endorphin and des-Tyr1-alpha-endorphin on alpha-MPT-induced catecholamine disappearance in rat brain nuclei: a dose--response study. Versteeg DH, et al. **Brain Res** 1982 Jan 14; 231(2):343-51

Endogenous opioid peptides. Goedert M, et al. **Bull Soc Sci Med Grand Duche Luxemb** 1981;118(1):7-17

Distribution of neuropeptides in the dorsal pontine tegmental area of the rat. Matsuzaki T, et al. **Cell Mol Biol** 1981;27(5):499-508

Central peptidergic stimulation in blood pressure control: role of enkephalins in rats. Yukimura T, et al. **Clin Sci [Suppl]** 1981 Dec; 61(7):347s-350s

Inhibition of the enzymatic degradation of Met-enkephalin by catecholamines. Caffrey JL, et al. **Endocrinology** 1982 Jan; 110(1):291-3

Dopaminergic inhibition of pituitary beta-endorphin-like immunoreactivity secretion in the rat. Farah JM Jr, et al. **Endocrinology** 1982 Feb;110(2):657-9

Evidence for independent secretion of beta-endorphin immunoreactivity from rat pars distalis in vivo. Pettibone DJ, et al. **Endocrinology** 1982 Feb;110(2):469-73

Characterization of an early inhibitory effect of glucocorticoids on stimulated adrenocorticotropin and endorphin release from a clonal strain of mouse pituitary cells. Phillips M, et al. **Endocrinology** 1982 Mar;110(3):892-900

In vivo corticotropin-releasing factor-induced secretion of adrenocorticotropin, beta-endorphin, and corticosterone. Rivier C, et al. **Endocrinology** 1982 Jan;110(1):272-8

A puberty-related attenuation of opiate peptide-induced inhibition of LH secretion. Wilkinson M, et al. **Endocrinology** 1982 Mar;110(3):1046-8

Biosynthesis of pairs of peptides related to melanotropin, corticotropin and endorphin in the pars intermedia of the amphibian pituitary gland. Martens GJ, et al. **Eur J Biochem** 1982 Feb;122(1):1-10

270-MHz 1H nuclear-magnetic-resonance study of met-enkephalin in solvent mixtures. Conformational transition from dimethylsulphoxide to water. Zetta L, et al. **Eur J Biochem** 1982 Feb;122(1):215-22

In vivo potentiation of [D-Ala2]Met-enkephalin amide central effects after administration of an enkephalinase inhibitor. Algeri S, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):261-2

Phosphoryl-Leu-Phe: a potent inhibitor of the degradation of enkephalin by enkephalinase. Altstein M, et al. **Eur J Pharmacol** 1981 Dec 3; 76(2-3):299-300

Opiate agonists inhibit neurogenic plasma extravasation in the rat. Barthó L, et al. **Eur J Pharmacol** 1981 Jul 17;73(1):101-4

Interaction of p-nitrophenylalanine enkephalins with mu-, delta- and kappa-subtypes of the opiate receptor. Fauchère JL, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):339-42

Opiate receptor-binding activity of [D-Thr2,Thz5]-and [D-Met2,Thz5]-enkephalinamides. Ferrara P, et al. **Eur J Pharmacol** 1981 Jul 17;73(1):69-73

ACTH1-24 counteracts the prolactin-releasing effect of an opioid. Ferri S, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):143-5

Calcium-opiate antagonism in the periaqueductal grey (PGA) region. Guerrero-Muñoz F, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):417-9

Excitability of beta-endorphin, morphine and catecholamines of the vas deferens of the rat at different stages of development. Huidobro-Toro JP, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):115-8

Des-tyr-gamma-endorphin (DT gamma E) and pineal levels of melatonin and arginine vasopressin (AVP). King MG, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):271-4

Mixed type inhibition of [D-Ala2, D-Leu5]enkephalin binding to mu-opiate binding sites by mu-, but not by kappa-opiate ligands. Pfeiffer A, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):359-61

Dynorphins: similar relative potencies on mu, delta- and kappa-opiate receptors. Quirion R, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):467-8

A characterization of dynorphin-(1-13) on the guinea pig ileal longitudinal muscle. Vaught JL. **Eur J Pharmacol** 1981 Dec 17;76(4):453-6

Effect of enkephalins in the presence of the antibiotic bacitracin in the longitudinal muscle strip preparation from guinea-pig ileum. Aleixandre A, et al. **Experientia** 1981 Dec 15;37(12):1318-20

Biogenic amines and beta-endorphin responses in the rat vas deferens. Miranda H, et al. **Gen Pharmacol** 1982;13(1):45-8

Comparative immunocytochemical localization of putative opioid ligands in the central nervous system. Stengaard-Pedersen K, et al. **Histochemistry** 1981;73(1):89-114 (50 ref.)

Lipolytic and enkephalinase inhibitory activities of polypeptides from placental autolysate prepared for therapeutic purposes. Nencini P, et al. **Int J Tissue React** 1981 Dec;3(3-4):167-72

beta-Endorphin and deletion peptides. A correlation of opiate receptor affinity with helix potential. Hammonds RG Jr, et al. **J Biol Chem** 1982 Mar 25;257(6):2990-5

Opioid peptides in human plasma: evidence for multiple forms. Boarder MR, et al. **J Clin Endocrinol Metab** 1982 Apr;54(4):715-20

Presence of immunoreactive gamma-melanocyte-stimulating hormone, adrenocorticotropin, and beta-endorphin in human gastric antral mucosa. Tanaka I, et al. **J Clin Endocrinol Metab** 1982 Feb; 54(2):392-6

Localization of methionine-enkephalin, substance P, and somatostatin immunoreactivities in the main olfactory bulb of the hamster. Davis BJ, et al. **J Comp Neurol** 1982 Feb 1;204(4):377-83

Beta-lipotropin and beta-endorphin in physiological and surgical menopause. Genazzani AR, et al. **J Endocrinol Invest** 1981 Oct-Dec; 4(4):375-8

Degradation and oxidation of methionine enkephalin by human neutrophils. Turkall RM, et al. **J Lab Clin Med** 1982 Mar; 99(3):418-27

Endorphins and legal issues. Harrison J. **J Leg Med (Chicago)** 1981 Dec; 2(4):543-68

Serotonin and gamma-aminobutyric acid turnover after injection into the median raphe of substance P and D-ala-met-enkephalin amide. Forchetti CM, et al. **J Neurochem** 1982 May;38(5):1336-41

Light and electron microscopic localization of immunoreactive Leu-enkephalin in the monkey basal ganglia. DiFiglia M, et al. **J Neurosci** 1982 Mar;2(3):303-20

Dopamine and [D-ALA2, D-Leu5]enkephalin inhibit the electrically stimulated neurohypophyseal release of vasopressin in vitro: evidence for calcium-dependent opiate action. Lightman SL, et al. **J Neurosci** 1982 Jan;2(1):78-81

Degradation of exogenous enkephalin in the guinea-pig ileum: relative importance of aminopeptidase, enkephalinase and angiotensin converting enzyme activity. Geary LE, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):104-11

Evidence for a gamma-aminobutyric acid (GABA) mediation in the benzodiazepine inhibition of the release of Met5-enkephalin elicited by depolarization. Harsing LG Jr, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):616-20

The effect of acute opioid administration on the phosphorylation of rat striatal synaptic membrane proteins. Williams N, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):278-86

Endorphin-mental illness link far from proved [news] Check WA. **JAMA** 1982 Feb 5;247(5):570-1, 575-7

Beta-adrenergic stimulation induces an increase of the plasma levels of immunoreactive alpha-MSH, beta-endorphin, ACTH and of corticosterone. Berkenbosch F, et al. **Life Sci** 1981 Nov 30; 29(22):2249-56

Age-related changes in central nervous system enkephalins and substance P. Dupont A, et al. **Life Sci** 1981 Nov 30;29(22):2317-22

The role of endorphins in neuropsychiatry. **Mod Probl Pharmacopsychiatry** 1981;17:1-290

Stress, endorphins and psychosis. A hypothesis. Amir S, et al. **Mod Probl Pharmacopsychiatry** 1981;17:192-201

Action of [Des-Tyr1]-gamma-endorphin in schizophrenia. Emrich HM, et al. **Mod Probl Pharmacopsychiatry** 1981;17:279-86

beta-Endorphin studies in psychiatric patients. Gorelick DA, et al. **Mod Probl Pharmacopsychiatry** 1981;17:236-45

Electroconvulsive shock results in a functional activation of endorphin systems. Holaday JW, et al. **Mod Probl Pharmacopsychiatry** 1981; 17:142-57

Effects of neuroleptic drugs on endogenous opioid peptides in the rat. Höllt V. **Mod Probl Pharmacopsychiatry** 1981;17:1-18

Role of endorphins in endogenous pain control systems. Mayer DJ, et al. **Mod Probl Pharmacopsychiatry** 1981;17:68-96

Anxiolytic properties of opiates and endogenous opioid peptides and their relationship to the actions of benzodiazepines. Millan MJ, et al. **Mod Probl Pharmacopsychiatry** 1981;17:123-41

Stress and endogenous opioid peptides: a review. Millan MJ. **Mod Probl Pharmacopsychiatry** 1981;17:49-67

Detoxication treatment of schizophrenic patients: a possible role of endorphins? Nedopil N, et al. **Mod Probl Pharmacopsychiatry** 1981; 17:263-5

Measurement of endorphins in CSF. Relationship to psychiatric diagnosis. Pickar D, et al. **Mod Probl Pharmacopsychiatry** 1981;17:246-62

Localization and modulation of enkephalins, endorphins and opiate receptors in the CNS and the pituitary gland. Simantov R. **Mod Probl Pharmacopsychiatry** 1981;17:38-48

Neuroleptic-like and antipsychotic effects of gamma-type endorphins. Van Ree JM, et al. **Mod Probl Pharmacopsychiatry** 1981;17:266-78

Primary structure of the human Met- and Leu-enkephalin precursor and its mRNA. Comb M, et al. **Nature** 1982 Feb 25;295(5851):663-6

Co-occurrence of substance P-like and Leu-enkephalin-like immunoreactivities in neurones and fibres of avian nervous system. Erichsen JT, et al. **Nature** 1982 Feb 4;295(5848):407-10

Molecular cloning establishes proenkephalin as precursor of enkephalin-containing peptides. Gubler U, et al. **Nature** 1982 Jan 21; 295(5846):206-8

A carboxypeptidase processing enzyme for enkephalin precursors. Hook VY, et al. **Nature** 1982 Jan 28;295(5847):341-2

Identification of a beta-endorphin-like peptide in cultured human placental cells. Liotta AS, et al. **Nature** 1982 Feb 18;

295(5850):593-5

Cloning and sequence analysis of cDNA for bovine adrenal preproenkephalin. Noda M, et al. **Nature** 1982 Jan 21; 295(5846):202-6

Isolation and structure of dynorphin, an opioid peptide, from porcine duodenum. Tachibana S, et al. **Nature** 1982 Jan 28;295(5847):339-40

O-sulphated Leu-enkephalin in brain. Unsworth CD, et al. **Nature** 1982 Feb 11;295(5849):519-22

beta-Endorphin is processed differently in specific regions of rat pituitary and brain. Zakarian S, et al. **Nature** 1982 Mar 18;296(5854):250-2

Analgesic activity of enkephalin analogues containing aminophosphonic acid residues at C-terminal position. Mastalerz P, et al. **Naturwissenschaften** 1982 Jan;69(1):46-7

Immunoreactive beta-endorphin in the plasma, pituitary and hypothalamus of young and old male rats. Forman LJ, et al. **Neurobiol Aging** 1981 Winter;2(4):281-4

Elevation of Met5-enkephalin and beta-endorphin hypothalamic content in rats receiving anorectic drugs: differences between D-fenfluramine and D-amphetamine. Harsing LG Jr, et al. **Neuropharmacology** 1982 Feb;21(2):141-5

Effects of acute and chronic haloperidol treatment on the concentrations of immunoreactive beta-endorphin in plasma, pituitary and brain of rats. Höllt V, et al. **Neuropharmacology** 1982 Feb;21(2):147-54

Endorphins in schizophrenia. van Ree JM, et al. **Neuropharmacology** 1981 Dec;20(12B):1271-7 (93 ref.)

Ultrastructural immunocytochemical localization of enkephalin in the goldfish preoptic nucleus. Cumming R, et al. **Neurosci Lett** 1981 Dec 23;27(3):313-8

Dramatic increase in pineal melatonin levels in the rat after subcutaneous injection of Des-tyrosine1-gamma-endorphin. Geffard M, et al. **Neurosci Lett** 1981 Dec 23;27(3):329-34

Evidence for analgesic activity of beta-casomorphin in rats. Grecksch G, et al. **Neurosci Lett** 1981 Dec 23;27(3):325-8

Enkephalin-like immunoreactivity in the gustatory lobes and visceral nuclei in the brains of goldfish and catfish. Finger TE. **Neuroscience** 1981;6(12):2747-58

Enkephalin-like immunoreactivity in the mossy fiber pathway of the hippocampal formation of the tree shrew (Tupaia glis). Fitzpatrick D, et al. **Neuroscience** 1981;6(12):2485-94

Enkephalin immunoreactivity in Golgi cells and mossy fibers of mammalian, avian, amphibian and teleost cerebellum. Schulman JA, et al. **Neuroscience** 1981;6(11):2407-16

Endorphins, opiate receptors and their evolving biology. Smith JR, et al. **Pathobiol Annu** 1981;11:87-126 (212 ref.)

Plasma opioids in the first hours of life. Facchinetti F, et al. **Pediatr Res** 1982 Feb;16(2):95-8

Effect of beta-endorphin on the thermal excitability of preoptic neurons in the unanesthetized rabbit. Gordon CJ, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):397-401

Cardiopulmonary pharmacology of enkephalins in the conscious dog. Sander GE, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):403-7

The correlation between swim-stress induced antinociception and [3H] leu-enkephalin binding to brain homogenates in mice. Christie MJ, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):853-7

Method of sacrifice influences leucine enkephalin binding to mouse brain. Christie MJ, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):849-51

Kyotorphins affect aversive pecking in chicks. Kastin AJ, et al. **Physiol Behav** 1981 Dec;27(6):1073-6

beta-Endorphin: demonstration of a tertiary structure in aqueous solution. Nicolas P, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7290-3

Human lymphocyte production of corticotropin and endorphin-like substances: association with leukocyte interferon. Smith EM, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7530-4

Tetraethylammonium facilitates the stimulation-evoked loss of the enkephalins from the myenteric plexus of guinea-pig ileum. Corbett AD, et al. **Proc R Soc Lond [Biol]** 1981 Oct 14;213(1191):171-82

Differential effects of warm- and cold-ambient temperature on blood levels of beta-endorphin and prolactin in the rat. Deeter WT 3d, et al. **Proc Soc Exp Biol Med** 1981 Dec;168(3):369-72

Running elevates plasma beta-endorphin immunoreactivity and ACTH in untrained human subjects. Gambert SR, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):1-4

(Des-tyrosine1)-gamma-endorphin in schizophrenia: clinical, biochemical, and hormonal aspects. Verhoeven WM, et al. **Psychiatry Res** 1981 Dec;5(3):293-309

beta-Endorphin and beta-lipotropin plasma levels in chronic schizophrenia, primary affective disorders and secondary affective disorders. Brambilla F, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):321-30

The effect of a synthetic met-enkephalin analogue (FK 33-824) on gastric acid secretion and serum gastrin in man. Skov Olsen P, et al. **Scand J Gastroenterol** 1981;16(4):531-3

Dynorphin and vasopressin: common localization in magnocellular neurons. Watson SJ, et al. **Science** 1982 Apr 2;216(4541):85-7

[Opioid peptides] Neuzil E, et al. **Expos Annu Biochim Med** 1982; 35:161-214 (287 ref.) (Fre)

[Effect of cold stress on the concentrations in the hypothalamus, pituitary, and blood of beta-lipotropin and beta-endorphin in the rabbit] Petraglia F, et al. **Boll Soc Ital Biol Sper** 1981 Sep 30;57(18):1862-8 (Eng. Abstr.) (Ita)

[Effects of intrathecal beta-endorphin and morphine on post-operative pain (author's transl)] Taniguchi K, et al. **Masui** 1981 Oct; 30(10):1105-11 (Eng. Abstr.) (Jpn)

[Neuropeptides in the rabbit eye. I. RIA for beta-endorphin, substance P and neurotensin in the aqueous humor, iris-ciliary body and retina (author's transl)] Baba S, et al. **Nippon Ganka Gakkai Zasshi** 1981 Sep 10;85(9):1267-72 (Eng. Abstr.) (Jpn)

[Comparative action of met-enkephalin and gamma-endorphin on the neuronal reactions of the rabbit dorsomedial hypothalamus to electrocutaneous and acupuncture stimulation] Iasnetsov VV, et al. **Dokl Akad Nauk SSSR** 1981;260(6):1502-8 (Rus)

[Enkephalin inhibition of the electrical activity of the visual cortex of the left and right hemispheres] Pivovarov AS, et al. **Dokl Akad Nauk SSSR** 1981;261(1):240-4 (Rus)

[Reaction between methionine enkephalin and human lymphocytes] Zozulia AA, et al. **Vestn Akad Med Nauk SSSR** 1982;(1):28-33 (Eng. Abstr.) (Rus)

ENURESIS

Treatment of enuresis with sydnocarb. Polák L, et al. **Act Nerv Super (Praha)** 1981;23(4):261-4

Nocturnal enuresis: an update on treatment. Schmitt BD. **Pediatr Clin North Am** 1982 Feb;29(1):21-36

EPHEDRINE

A study of the thermic responses to a meal and to a sympathomimetic drug (ephedrine) in relation to energy balance in man. Morgan JB, et al. **Br J Nutr** 1982 Jan;47(1):21-32

Selected cardiac and metabolic responses to pseudoephedrine with exercise. Bright TP, et al. **J Clin Pharmacol** 1981 Nov-Dec; 21(11-12 Pt 1):488-92

EPINEPHRINE

Effect of insulin and epinephrine on some early oestrogenic responses in the rat uterus. Steinsapir J, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):263-71

Role of some biogenic amines in the pathomechanism of glomerulonephritis. II. Adrenaline, noradrenaline and serotonin in acute serum sickness in rabbits. Gębala A, et al. **Acta Physiol Pol** 1981; 32(4):363-73

Role of some biogenic amines in the pathomechanism of glomerulonephritis. Zajączkowska M, et al. **Acta Physiol Pol** 1981; 32(4):375-82

Epinephrine potentiation of arachidonate-induced aggregation of cyclooxygenase-deficient platelets. Rao GH, et al. **Am J Hematol** 1981; 11(4):355-66

Renal handling of dopa, dopamine, norepinephrine, and epinephrine in the dog. Ball SG, et al. **Am J Physiol** 1982 Jan;242(1):F56-62

Rapid fluctuations in plasma catecholamines in monkeys under undisturbed conditions. Hansen BC, et al. **Am J Physiol** 1982 Jan; 242(1):E40-6

Parathyroid gland response to epinephrine: a rate-sensitivity mechanism. Jung A, et al. **Am J Physiol** 1982 Jan;242(1):R151-6

Catecholamine release and blood pressure changes induced by exercise in dogfish. Opdyke DF, et al. **Am J Physiol** 1982 Mar; 242(3):R306-10

Neural and extraneural catecholamine production by rat kidneys. Stephenson RK, et al. **Am J Physiol** 1982 Mar;242(3):F261-6

Urinary excretion of catecholamines in the night monkey (Aotus trivirgatus) (Primates, Cebidae). Peyrin L, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):345-56

The effect of echothiophate on the biphasic response of rabbit ocular pressure to dipivefrin. Mindel JS, et al. **Arch Ophthalmol** 1982 Jan; 100(1):147-51

Activation of hormone-sensitive lipase: disparity between evaluations in intact and disrupted fat cells. Salers P, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):813-8

In vitro desensitization of human lymphocytes by epinephrine. Krall JF, et al. **Biochem Pharmacol** 1982 Jan 1;31(1):117-9

Catecholamine-stimulation of Cl- secretion in MDCK cell epithelium. Brown CD, et al. **Biochim Biophys Acta** 1981 Dec 7;649(2):427-35

Catecholamine content of chromaffin granule 'ghosts' isolated from bovine adrenal glands. Deupree JD, et al. **Biochim Biophys Acta** 1982 Feb 25; 714(3):471-8

The reversible inhibition by carbonyl cyanide m-chlorophenyl hydrazone of epinephrine-stimulated lipolysis in perifused isolated fat cells. Huber CT, et al. **Biochim Biophys Acta** 1981 Dec 23;666(3):462-7

Regulation of adrenergic stimulation of hepatic adenylate cyclase by divalent cations. Jackowski MM, et al. **Biochim Biophys Acta** 1982 Jan 12;714(1):74-83

Nitriphenol compound induces Ca-dependent exocytotic secretion of catecholamines by a direct effect on the plasma membranes of the adrenal medullary cells. Sorimachi M, et al. **Brain Res** 1982 Jan 28; 232(1):242-6

2,4-Dinitrophenol—mechanism of action. El-Guindy MM, et al. **Cell Mol Biol** 1981;27(5):399-402

Influence of somatostatin on plasma cyclic AMP and metabolic substrate responses to i.v. adrenaline and glucagon in humans. Nistrup Madsen S, et al. **Clin Endocrinol (Oxf)** 1981 Nov;15(5):431-7

Evidence for the involvement of central epinephrine systems in the regulation of luteinizing hormone, prolactin, and growth hormone release in female rats. Crowley WR, et al. **Endocrinology** 1982 Apr; 110(4):1102-7

Specific inhibition by glucocorticoids of the alpha 2-adrenergic stimulation of adrenocorticotropin release in rat anterior pituitary cells. Giguère V, et al. **Endocrinology** 1982 Apr;110(4):1225-30

Epinephrine-sensitive adenylyl cyclase activity in rabbit ovarian tissues. Hunzicker-Dunn M. **Endocrinology** 1982 Jan;110(1):233-40

Abnormalities of insulin secretory and lipolytic response to epinephrine produced by a high fat diet and electric stress in rats. Yamaguchi K, et al. **Endokrinologie** 1981 Dec;78(2-3):253-61

Discrepancy in the regulatory effects of sodium and guanine nucleotides on adrenaline and clonidine binding to alpha 2-adrenoceptors in human fat cell membranes. Gonzalez JL, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):289-93

Desensitization of the beta-adrenergic receptor-adenylate cyclase complex in rabbit iris-ciliary body induced by topical epinephrine. Mittag T, et al. **Exp Eye Res** 1981 Nov;33(5):497-503

Close relationship of mitochondria with intercellular junctions in the adrenaline cells of the mouse adrenal gland. Grynszpan-Winograd O. **Experientia** 1982 Feb 15;38(2):270-1

Chronic exercise does not alter the chronotropic response of isolated rat atria to catecholamines. Smith DC, et al. **Experientia** 1982 Feb 15; 38(2):260-1

Associations between rates of urinary catecholamine excretion and aspects of lifestyle among adult women in some Oxfordshire villages. Harrison GA, et al. **Hum Biol** 1981 Dec;53(4):617-33

Plasma catecholamines in trained and untrained volunteers during graduated exercise. Lehmann M, et al. **Int J Sports Med** 1981 Aug; 2(3):143-7

Studies of the interaction between glucagon and alpha-adrenergic agonists in the control of hepatic glucose output. Assimacopoulos-Jeannet FD, et al. **J Biol Chem** 1982 Apr 10;257(7):3759-65

The effects of age on the plasma catecholamine response to mental stress in man. Barnes RF, et al. **J Clin Endocrinol Metab** 1982 Jan; 54(1):64-9

Regulation of episodic growth hormone secretion by the central epinephrine system. Studies in the chronically cannulated rat. Terry LC, et al. **J Clin Invest** 1982 Jan;69(1):104-12

Effects of catecholamines on free fatty acid release from bone marrow adipose tissue. Tran MA, et al. **J Lipid Res** 1981 Nov;22(8):1271-6

(alpha S)-erythro-alpha-methylepinephrine: preparation and stereoselective binding to adrenergic receptors in rat forebrain. Taylor CA Jr, et al. **J Med Chem** 1981 Oct;24(10):1261-3

Changes in plasma noradrenaline and adrenaline associated with central and peripheral thermal stimuli in the pig. Barrand MA, et al. **J Physiol (Lond)** 1981 Jul;316:139-52

Calcium and the alpha-action of catecholamines on guinea-pig taenia caeci. Den Hertog A. **J Physiol (Lond)** 1981 Jul;316:109-25

Cimetidine alters plasma catecholamine levels and cortisol and aldosterone excretion [letter] Feely J, et al. **N Engl J Med** 1982 Apr 29; 306(17):1054

Neonatal adaptation: sympatho-adrenal response to umbilical cord cutting. Padbury JF, et al. **Pediatr Res** 1981 Dec;15(12):1483-7

Effect of epinephrine on glucose metabolism in kid liver slices. Machaňová L, et al. **Physiol Bohemoslov** 1981;30(6):573-6

Epinephrine induced myocardial necrosis: effects of aminophylline and adrenergic blockade. Blaiklock RG, et al. **Res Commun Chem Pathol Pharmacol** 1981 Nov;34(2):179-92

[Effects of adrenaline, noradrenaline and isoprenaline administration on carbohydrate and lipid metabolism parameters in swine blood plasma] Brenner KV, et al. **Arch Exp Veterinarmed** 1981;35(5):697-706 (Eng. Abstr.) (Ger)

[The aerobic and anaerobic capacity of adolescents and catecholamine excretion during prolonged submaximal exercise (author's transl)] Lehmann M, et al. **Eur J Applied Physiol** 1982;48(1):135-45 (Eng. Abstr.) (Ger)

[On the National Institute of Hygienic Sciences Standard (Japanese Pharmacopoeia Standard) 'Epinephrine Bitartrate Reference Standard (Control 781)' and 'Norepinephrine Bitartrate Reference Standard (Control 791)' (author's transl)] Kimura T, et al. **Eisei Shikenjo Hokoku** 1981;99:118-21 (Eng. Abstr.) (Jpn)

[Effects of adrenaline, noradrenaline and pilocarpine on the oxygen uptake in rat submandibular gland (author's transl)] Sakamoto S, et al. **Nippon Seirigaku Zasshi** 1981;43(10):469-78 (Eng. Abstr.) (Jpn)

[Effect of catecholamines on the morphological picture of the peripheral autonomic nervous system of the digestive tract of rats—light-microscopical study] Jędrzejewska A, et al. **Patol Pol** 1981; 32(2):233-42 (Eng. Abstr.) (Pol)

[Effect of adrenaline administration on the interrelation between free fatty acid concentration in the blood and platelet accumulation in the circulatory bed of the myocardium] Gereliuk IP. **Biull Eksp Biol Med** 1981 Dec;92(12):661-3 (Eng. Abstr.) (Rus)

[Morphologic changes in the hematopoietic organs of rats in response to adrenaline] Khil'ko AS, et al. **Fiziol Zh** 1982 Jan-Feb;28(1):40-5 (Eng. Abstr.) (Rus)

[Changes in intraocular pressure following local injection of catecholamines into the hypothalamus] Danilov GE, et al. **Fiziol Zh SSSR** 1981 Oct;67(10):1487-92 (Eng. Abstr.) (Rus)

[Determination of the adrenaline concentration in human saliva] Semenkova GN, et al. **Lab Delo** 1982;(1):15-7 (Eng. Abstr.) (Rus)

[Changes in the catecholamine content in adrenaline-synthetizing structures of the medulla oblongata in rats with different reactions to long-term immobilization] Kvetnansky R, et al. **Probl Endokrinol (Mosk)** 1981;27(6):58-63 (Eng. Abstr.) (Rus)

[Action of propranolol, nifenalol, and pindolol on the lipolytic effect of adrenaline in the rat epididymis] Sánchez-Cuadrado MC, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):181-2 (Spa)

ESCAPE REACTION

Increased serotonin level via augmented tryptophan diet and its effect on escape learning. Yehuda S, et al. **Int J Neurosci** 1981; 15(4):193-6

ESTRADIOL

Effect of 2-substituted oestrogens in vivo on the metabolism of noradrenaline in rat brain. Köster G, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):1-8

Effect of insulin and epinephrine on some early oestrogenic responses in the rat uterus. Steinsapir J, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):263-71

Release of LH in vitro from anterior pituitary glands of ovariectomized rats by LRH or elevated potassium concentration after pre-treatment with oestradiol benzoate in vivo. Tijssen AM, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):206-10

The effect of gonadotropin-releasing hormone on ovarian estradiol secretion. Kletzky OA, et al. **Am J Obstet Gynecol** 1982 Feb 15; 142(4):427-31

Involvement of GABA in the feedback action of estradiol on gonadotropin and prolactin release: hypothalamic GABA and catecholamine turnover rates. Mansky T, et al. **Brain Res** 1982 Jan 14;231(2):353-64

Comparative effects of estrogens and prolactin on nigral and striatal GAD activity. Nicoletti F, et al. **Brain Res** 1982 Jan 28;232(1):238-41

Effects of ovarian steroids on serotonin metabolism within grossly dissected and microdissected brain regions of the ovariectomized rat. Cone RI, et al. **Brain Res Bull** 1981 Dec;7(6):639-44

The luteinizing hormone-releasing hormone (LHRH) system in normal and estrogenized neonatal rats. Elkind-Hirsch K, et al. **Brain Res Bull** 1981 Dec;7(6):645-54

Somatostatin inhibits prolactin secretion in the estradiol primed male rat. Cooper GR, et al. **Can J Physiol Pharmacol** 1981 Oct;59(10):1082-8

Studies on the microheterogeneity of follicle-stimulating hormone present within the anterior pituitary gland of ovariectomized hamsters. Chappel SC, et al. **Endocrinology** 1982 Mar;110(3):847-54

Pituitary receptor sites for gonadotropin-releasing hormone: effect of castration and substitutive therapy with sex steroids in the male rat. Conne BS, et al. **Endocrinology** 1982 Jan;110(1):70-9

Ovarian steroids modulate the self-priming effect of luteinizing hormone-releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **Endocrinology** 1982 Mar;110(3):717-21

Estrogen in high doses inhibits perphenazine-induced prolactin release. Sinha YN, et al. **Endocrinology** 1982 Jan;110(1):126-30

Evaluation of Delestrogen and Parlodel as a luteolytic agent in humans. Blackwell RE, et al. **Fertil Steril** 1982 Feb;37(2):213-7

The luteolytic and abortifacient potential of an estrogen-bromergocryptine regimen in the baboon. Castracane VD, et al. **Fertil Steril** 1982 Feb;37(2):258-62

Inhibin-like activity and steroid content in human follicular fluid during the periovulatory period. Lefevre B, et al. **Int J Fertil** 1981; 26(4):295-6

Effect of oestrogen on gonadotrophin release in stumptailed monkeys (Macaca arctoides) treated chronically with an agonist analogue of luteinizing hormone releasing hormone. Fraser HM. **J Endocrinol** 1981 Dec;91(3):525-30

Effects of estradiol on norepinephrine and prostaglandin efflux in medial basal hypothalamus of ovariectomized rats. Cardinali DP, et al. **J Neural Transm** 1982;53(1):39-47

Modulation by estradiol of serotonin receptors in brain. Biegon A, et al. **J Neurosci** 1982 Feb;2(2):199-205

Motor activity of the human Fallopian tube in vitro in relation to plasma concentration of oestradiol and progesterone, and the influence of noradrenaline. Heim G, et al. **J Reprod Fertil** 1982 Jan;64(1):233–42

Comparison of steroid and LH-RH effects on the responsiveness of hemipituitary glands and dispersed pituitary cells. Speight A, et al. **Mol Cell Endocrinol** 1981 Dec;24(3):267–81

Dissociation of the effects of gonadal steroids on brain serotonin metabolism and sexual behavior in the male rat. Bradshaw WG, et al. **Neuroendocrinology** 1982 Jan;34(1):38–45

Differential effects of low serum levels of estradiol-17 beta on hypothalamic LHRH levels and LH secretion in castrated male rats. Kalra PS, et al. **Neuroendocrinology** 1981 Dec;33(6):340–6

Temporal and other effects of catechol estrogens on prolactin secretion in the rat. Shin SH, et al. **Neuroendocrinology** 1981 Dec;33(6):352–7

Prepuberal ontogeny of responsiveness to estradiol in female rat central nervous system. Dudley SD. **Neurosci Biobehav Rev** 1981 Winter; 5(4):421–35 (238 ref.)

[Ureteral response, through adrenergic stimulation, to the action of progesterone and estradiol] García Sacristán A, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):129–32 **(Spa)**

EXPLORATORY BEHAVIOR

Behavior during hippocampal microinfusions. I. Norepinephrine and diversive exploration. Flicker C, et al. **Brain Res** 1982 Mar; 237(1):79–103

Arginine vasotocin: effects on open field behavior, whole brain monoamines and plasma corticosterone. Golus P, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):437–40

Cholecystokinin reduces exploratory behavior in mice. Crawley JN, et al. **Physiol Behav** 1981 Sep;27(3):407–11

EXTINCTION (PSYCHOLOGY)

Failure to obtain functional equivalence between dopamine receptor blockade and extinction: evidence supporting a sensory-motor conditioning hypothesis. Tombaugh TN, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):67–72

FEAR

Two opposite effects of diazepam on fear by differential training in the CER-paradigm. Haug T, et al. **Psychopharmacology (Berlin)** 1981; 75(2):110–3

[Role of corticosteroids in the development of fear and aggression reactions] Malyshenko NM. **Zh Vyssh Nerv Deiat** 1982 Jan–Feb; 32(1):144–51 (Eng. Abstr.) **(Rus)**

FENFLURAMINE

Kinetics of fenfluramine isomers in the rat. Caccia S, et al. **Eur J Drug Metab Pharmacokinet** 1981;6(4):297–301

Drug preferences in humans. Johanson CE, et al. **Fed Proc** 1982 Feb; 41(2):228–3?

Central mechanisms of fenfluramine and related anorectic drugs. Garattini S. **Jpn J Pharmacol** 1981;31 Suppl:29P–35P (26 ref.)

Elevation of Met5-enkephalin and beta-endorphin hypothalamic content in rats receiving anorectic drugs: differences between D-fenfluramine and D-amphetamine. Harsing LG Jr, et al. **Neuropharmacology** 1982 Feb;21(2):141–5

Ontogeny of fenfluramine and amphetamine anorexia compared in rat pups. Leshem M. **Pharmacol Biochem Behav** 1981 Dec;15(6):?59–63

The effects of quipazine, fenfluramine and apomorphine on the morphine potentiation of tonic immobility. Wallnau LB. **Pharmacol Biochem Behav** 1981 Dec;15(6):895–901

FLUPHENAZINE

Fluphenazine and flupenthixol decanoate in psychiatric outpatients practice. Coufal J, et al. **Act Nerv Super (Praha)** 1981;23(4):269–71

Plasma imipramine concentrations in patients receiving concomitant fluphenazine decanoate. Siris SG, et al. **Am J Psychiatry** 1982 Jan; 139(1):104–6

Fluphenazine vs placebo in patients with remitted, acute first-episode schizophrenia. Kane JM, et al. **Arch Gen Psychiatry** 1982 Jan; 39(1):70–3

Calmodulin is involved in the first step of oocyte maturation: effects of the antipsychotic drug fluphenazine and of anticalmodulin antibodies on the progesterone-induced maturation of xenopus laevis oocyte. Cartaud A, et al. **Cell Differ** 1981 Dec;10(6):357–63

Effects of age on dopaminergic supersensitivity induced by chronic fluphenazine. Misra CH, et al. **Commun Psychopharmacol** 1980; 4(5):411–5

Influence of age on the effects of chronic fluphenazine on receptor binding in rat brain. Misra CH, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):317–24

Chronic treatment with haloperidol or fluphenazine decanoate: regional effects on dopamine and serotonin metabolism in primate brain. Bacopoulos NG, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):22–8

Treatment of unstable detrusor (irritable bladder) using fluphenazine and nortriptyline: progress report. Martin MR, et al. **Prog Clin Biol Res** 1981;78:335–8

The use of fluphenazine decanoate (Modecate)depot therapy in outpatient schizophrenics-a retrospective study. Tan CT, et al. **Singapore Med J** 1981 Aug;22(4):214–8

[Clinical observation on the effect of domestic fluphenazine decanoate in the treatment of schizophrenia---report of 431 cases (author's transl)] Zhang YF. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1981 Aug; 14(3):182–5 **(Chi)**

[Treatment of schizophrenic psychoses by sustained-action neuroleptics in psychiatric outpatients' treatment (author's transl)] Poláček J. **Cesk Psychiatr** 1982 Feb;78(1):49–55 (Eng. Abstr.) **(Cze)**

[Comparison between the effectiveness of fluphenazine decanoate and oxyprothepin decanoate in schizophrenia (double-blind crossover study)] Balon R, et al. **Zh Nevropatol Psikhiatr** 1982;82(1):116–8 (Eng. Abstr.) **(Rus)**

[Follow-up study of patients treated with depot phenothiazines in Valparaiso, Chile] Michel G, et al. **Bol Of Sanit Panam** 1981 Nov; 91(5):418–27 (Eng. Abstr.) **(Spa)**

FLURAZEPAM

Assay of flunitrazepam, temazepam and desalkylflurazepam in plasma by capillary gas chromatography with electron-capture detection. Jochemsen R, et al. **J Chromatogr** 1982 Jan 8;227(1):199–206

GLC-ECD determination of 1-(2-hydroxyethyl)-3-hydroxy-7-chloro-1,3-dihydro-5-(O-fluorophe (SAS 643) in plasma and urine and identification of its main biotransformation products. Mardente S, et al. **Ther Drug Monit** 1981; 3(4):351–6

Quantitative EEG and behavioral effects in volunteers of a new benzodiazepine (SAS 643) in relation to drug plasma concentration. Sannita WG, et al. **Ther Drug Monit** 1981;3(4):341–9

FOOD DEPRIVATION

Effect of food deprivation on rat gastric somatostatin and gastrin release. Koop H, et al. **Gastroenterology** 1982 May;82(5 Pt 1):871–6

Mild zinc deficiency and undernutrition during the prenatal and postnatal periods in rats: effects on weight, food consumption, and brain catecholamine concentrations. Halas ES, et al. **J Nutr** 1982 Mar; 112(3):542–51

Effects of early overnutrition and undernutrition in rats on the metabolic responses to overnutrition in later life. Rothwell NJ, et al. **J Nutr** 1982 Mar;112(3):426–35

FSH

Gonadotrophin releasing hormone causes a biphasic secretion of luteinizing hormone and follicle stimulating hormone by cultures of rat anterior pituitary cells. Eddie LW, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):44–9

The role of catecholamines in the regulation of pituitary luteinizing hormone and follicle-stimulating hormone secretion. Barraclough CA, et al. **Endocr Rev** 1982 Winter;3(1):91–119 (268 ref.)

Norepinephrine in Graafian follicles is depleted by follicle-stimulating hormone. Ben-Jonathan N, et al. **Endocrinology** 1982 Feb; 110(2):457–61

Studies on the microheterogeneity of follicle-stimulating hormone present within the anterior pituitary gland of ovariectomized hamsters. Chappel SC, et al. **Endocrinology** 1982 Mar;110(3):847–54

Intraventricular injection of follicle-stimulating hormone (FSH) during proestrus stimulates the rise in serum FSH on estrus in phenobarbital-treated hamsters through a central nervous system-dependent mechanism. Coutifaris C, et al. **Endocrinology** 1982 Jan;110(1):105–13

Melatonin directly inhibits rat gonadotroph cells. Martin JE, et al. **Endocrinology** 1982 Apr;110(4):1079–84

Ovarian steroids modulate the self-priming effect of luteinizing hormone-releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **Endocrinology** 1982 Mar;110(3):717–21

Effect of pulsatile gonadotropin-releasing hormone on the release of luteinizing hormone and follicle-stimulating hormone in vitro by anterior pituitaries from lactating and cycling rats. Smith MS. **Endocrinology** 1982 Mar;110(3):882–91

Regulation of tonic gonadotropin release in prepubertal female hamsters. Smith SG 3d, et al. **Endocrinology** 1982 Apr;110(4):1262–7

Basal and GnRH-induced release and synthesis of LH and FSH from incubated pituitary glands throughout the 4-day estrous cycle of the rat. Apfelbaum ME. **Horm Res** 1981;15(2):109–21

Further studies of the effects of intravenous infusion or intramuscular injection of gonadotropin-releasing hormone during childhood and adolescence. Reiter EO, et al. **J Adolesc Health Care** 1981 Jun; 1(4):275–81

Development of a homologous radioimmunoassay for ovine follicle stimulating hormone: studies after estrus, ovariectomy, estradiol and releasing hormone. Bolt DJ. **J Anim Sci** 1981 Sep;53(3):730–41

Effects of porcine follicular fluid on gonadotropin concentrations in rhesus monkeys. Rettori V, et al. **J Clin Endocrinol Metab** 1982 Mar; 54(3):500–3

Effects of LHRH and long–acting LHRH on serum LH and FSH levels of healthy women. Bartfai G, et al. **J Endocrinol Invest** 1981 Jul–Sep; 4(3):359–62

Pituitary cell cultures as a tool for the studies on the GnRH–induced release and biosynthesis of gonadotropins. Jutisz M, et al. **Mater Med Pol** 1980 Jan–Jun;12(1–2):53–62

[Studies on the feedback regulation of gonadotropin concentrations in male rats (I). The effects of hypothalamic implantation of testosterone and its metabolites on gonadotropin release in castrated male rats (author's transl)] Noguchi K. **Nippon Naibunpi Gakkai Zasshi** 1981 Aug 20;57(8):1139–47 (Eng. Abstr.) **(Jpn)**

GABA

The action of putative neurotransmitter substances in the cat labyrinth. Felix D, et al. **Acta Otolaryngol (Stockh)** 1982 Jan–Feb; 93(1–2):101–5

GABA and the basal ganglia. **Adv Biochem Psychopharmacol** 1981; 30:1–241

Interactions between GABA, dopamine, acetylcholine, and glutamate–containing neurons in the extrapyramidal and limbic systems. Bartholini G, et al. **Adv Biochem Psychopharmacol** 1981;30:119–28

Evidence in favour of GABA as an inhibitory transmitter in the rat striatum. Bernardi G, et al. **Adv Biochem Psychopharmacol** 1981; 30:69–77

In vivo release of 3H–GABA synthesized from 3H–Glutamine in the substantia nigra and the pallido entopeduncular nuclei in the cat. Besson MJ, et al. **Adv Biochem Psychopharmacol** 1981;30:95–103

Role of GABA neurons in the expression of striatal motor functions. Di Chiara G, et al. **Adv Biochem Psychopharmacol** 1981;30:129–63 (77 ref.)

Electrophysiological studies of GABAergic neurons in the basal ganglia: nigro–collicular, nigro–thalamic, and pallido–subthalamic neurons. Feger J. **Adv Biochem Psychopharmacol** 1981;30:53–68

Evidence for the involvement of nigrothalamic GABA neurons in circling behaviour in the rat. Kilpatrick IC, et al. **Adv Biochem Psychopharmacol** 1981;30:205–24

Distribution and release of GABA in the basal ganglia. Korf J, et al. **Adv Biochem Psychopharmacol** 1981;30:105–17

The GABAergic neurons of the extrapyramidal system as revealed by immunocytochemistry. Ribak CE. **Adv Biochem Psychopharmacol** 1981; 30:23–36

Role of GABA in the striatal output system: globus pallidus, nucleus entopeduncularis, substantia nigra and nucleus subthalamicus. Scheel–Krüger J, et al. **Adv Biochem Psychopharmacol** 1981; 30:165–86 (92 ref.)

Single unit responses of substantia nigra and globus pallidus neurons to GABA agonist and antagonist drugs. Waszczak BL, et al. **Adv Biochem Psychopharmacol** 1981;30:79–94

The GABAergic systems and the role of basal ganglia in motor control. Yoshida M. **Adv Biochem Psychopharmacol** 1981;30:37–52

Differential effects of light and dark adaptations on function and metabolism of retinal taurine and gamma–aminobutyric acid (GABA). Kuriyama K, et al. **Adv Exp Med Biol** 1981;139:221–38

CSF levels of gamma–aminobutyric acid in schizophrenia. Low values in recently ill patients. van Kammen DP, et al. **Arch Gen Psychiatry** 1982 Jan;39(1):91–7

Inhibition of neuronal GABA uptake and glial beta–alanine uptake by synthetic GABA analogues. Breckenridge RJ, et al. **Biochem Pharmacol** 1981 Nov 15;30(22):3045–9

Inhibition by apomorphine of the potassium–evoked release of [3H]–gamma–aminobutyric acid from the rat substantia nigra in vitro. Arbilla S, et al. **Br J Pharmacol** 1981 Oct;74(2):389–97

Inner plexiform circuits in the carp retina: effects of cholinergic agonists, GABA, and substance P on the ganglion cells. Glickman RD, et al. **Brain Res** 1982 Feb 18;234(1):81–99

GABA uptake and release in purified neuronal and nonneuronal cultures from chick embryo retina. Hyndman AG, et al. **Brain Res** 1982 Feb; 255(2):167–80

Involvement of GABA in the feedback action of estradiol on gonadotropin and prolactin release: hypothalamic GABA and catecholamine turnover rates. Mansky T, et al. **Brain Res** 1982 Jan 14;231(2):353–64

Release of GABA from the guinea–pig neocortex induced by electrical stimulation of the 'locus coeruleus' or by norepinephrine. Moroni F, et al. **Brain Res** 1982 Jan 28;232(1):216–21

Dopamine blocks carrier–mediated release of GABA from retinal horizontal cells. Yazulla S, et al. **Brain Res** 1982 Feb 4;233(1):211–5

Chemoreceptors for serotonin (5–HT), acetylcholine (ACh), bradykinin (BK), histamine (H) and gamma–aminobutyric acid (GABA) on rabbit visceral afferent neurons. Higashi H, et al. **Brain Res Bull** 1982 Jan; 8(1):23–32

Ontogeny of 3H–diazepam binding sites in different rat brain area. Effect of GABA. Aldinio C, et al. **Dev Neurosci** 1981;4(6):461–6

Affinity of thiocolchicoside and thiocolchicoside analogues for the postsynaptic GABA receptor site. Biziere K, et al. **Eur J Pharmacol** 1981 Oct 22;75(2–3):167–8

Endogenous GABA determines the characteristics of [3H]GABA–binding. Gardner CR, et al. **Eur J Pharmacol** 1981 Oct 22;75(2–3):83–92

The effect of GABA antagonism on propulsive activity of the guinea–pig large intestine. Krantis A, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):111–4

Depolarizing IPSPs and Depolarization by GABA of rat neostriatum cells in vitro. Misgeld U, et al. **Exp Brain Res** 1982;45(1–2):108–14

K+–stimulated release of endogenous glutamate, GABA and other amino acids from neuron– and glia–enriched cultures of the rat cerebellum. Pearce BR, et al. **FEBS Lett** 1981 Nov 30;135(1):215–8

Liposome–induced changes in the uptake of GABA and glutamate in mouse brain in vitro. Dam M, et al. **Ital J Neurol Sci** 1981 Dec; 2(4):375–7

Plasma GABA in affective illness. A preliminary investigation. Petty F, et al. **J Affective Disord** 1981 Dec;3(4):339–43

Determination of gamma–aminobutyric acid by liquid chromatography with electrochemical detection. Caudill WL, et al. **J Chromatogr** 1982 Feb 12;227(2):331–9

Possible inhibitory influence of gamma–aminobutyric acid on growth hormone secretion in the rat. Fiók J, et al. **J Endocrinol** 1981 Dec; 91(3):391–7

Inhibition of [3H]GABA binding to postsynaptic receptors in human cerebellar synaptic membranes by carboxyl and amino derivatives of GABA. Breckenridge RJ, et al. **J Neurochem** 1981 Oct;37(4):837–44

Pyrrolines as prodrugs of gamma–aminobutyric acid analogues. Callery PS, et al. **J Neurochem** 1982 Apr;38(4):1063–7

Phosphatidylserine enhancement of [3H]gamma–aminobutyric acid uptake by rat whole brain synaptosomes. Chweh AY, et al. **J Neurochem** 1982 Mar;38(3):691–5

In vitro effect of tetanus toxin on GABA release form rat hippocampal slices. Collingridge GL, et al. **J Neurochem** 1981 Oct;37(4):1039–41

Higher GABA concentrations in fallopian tube than in brain of the rat. Erdö SL, et al. **J Neurochem** 1982 Apr;38(4):1174–6

The binding of the GABA agonist [3H]THIP to rat brain synaptic membranes. Falch E, et al. **J Neurochem** 1982 Apr;38(4):1123–9

A regional study of 4–aminobutyrate metabolism and amino acid levels in rat brain following chronic oral administration of ethanolamine O–sulphate. Fletcher A, et al. **J Neurochem** 1982 Apr;38(4):1022–8

The topographical distribution of alanine, aspartate, gamma–aminobutyric acid, glutamate, glutamine, and glycine in the pigeon optic tectum and the effect of retinal ablation. Fonnum F, et al. **J Neurochem** 1982 Apr; 38(4):1130–4

Serotonin and gamma–aminobutyric acid turnover after injection into the median raphe of substance P and D–ala–met–enkephalin amide. Forchetti CM, et al. **J Neurochem** 1982 May;38(5):1336–41

Neuronal and glial release of [3H]GABA from the rat olfactory bulb. Jaffé EH, et al. **J Neurochem** 1981 Dec;37(6):1457–66

Effect of homo–beta–proline and other heterocyclic GABA analogues on GABA uptake in neurons and astroglial cells and on GABA receptor binding. Larsson OM, et al. **J Neurochem** 1981 Dec;37(6):1509–16

Ethylenediamine as a specific releasing agent of gamma–aminobutyric acid in rat striatal slices. Lloyd HG, et al. **J Neurochem** 1982 Apr; 38(4):1168–9

Transport of GABA at the blood–CSF interface. Löscher W, et al. **J Neurochem** 1982 Apr;38(4):1072–9

Comparative effects of chronic haloperidol and sulpiride treatment on nigral and striatal GABA content. Nicoletti F, et al. **J Neurochem** 1981 Oct;37(4):1048–51

Effects of anticonvulsants on the formation of gamma–hydroxybutyrate from gamma–aminobutyrate in rat brain. Whittle SR, et al. **J Neurochem** 1982 Mar;38(3):848–51

Interactions of di–n–propylacetate, gabaculine, and aminooxyacetic acid: anticonvulsant activity and the gamma–aminobutyrate system. Wood JD, et al. **J Neurochem** 1981 Dec;37(6):1440–7

The uptake of [3H]gamma–aminobutyric acid by isolated glial (Müller) cells from the mouse retina. Sarthy PV. **J Neurosci Methods** 1982 Jan; 5(1–2):77–82

Evidence for a gamma–aminobutyric acid (GABA) mediation in the benzodiazepine inhibition of the release of Met5–enkephalin elicited by depolarization. Harsing LG Jr, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):616–20

gamma–Aminobutyric acid (GABA) receptor stimulation. II. Specificity of progabide (SL 76002) and SL 75102 for the GABA receptor. Lloyd KG, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):672–7

Valproic acid: brain and plasma levels of the drug and its metabolites, anticonvulsant effects and gamma–aminobutyric acid (GABA) metabolism in the mouse. Nau H, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):654–9

gamma–Aminobutyric acid (GABA) receptor stimulation. IV. Effect of progabide (SL 76002) and other GABAergic agents on acetylcholine turnover in rat brain areas. Scatton B, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):689–95

gamma–Aminobutyric acid (GABA) receptor stimulation. III. Effect of progabide (SL 76002) on norepinephrine, dopamine and

5-hydroxytryptamine turnover in rat brain areas. Scatton B, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):678–88

Comparison of the effects of GABA and chloride ion on the affinities of ligands for the benzodiazepine receptor. Fujimoto M, et al. **Life Sci** 1982 Jan 4;30(1):51–7

Sodium valproate exerts anti-conflict activity in rats without any concomitant rise in forebrain GABA level. Rasmussen KJ, et al. **Life Sci** 1981 Nov 23;29(21):2163–70

Comparison of content with synthesis, uptake and breakdown of GABA in substantia nigra of unoperated, hemitransected and kainate-treated rats. Starr M, et al. **Life Sci** 1981 Nov 30;29(22):2281–7

Halide- and gamma-aminobutyric acid-induced enhancement of diazepam receptors in rat brain. Reversal by disulfonic stilbene blockers of anion channels. Costa T, et al. **Mol Pharmacol** 1981 Nov;20(3):470–6

gamma-Aminobutyric acid enhancement of CL 218,872 affinity and evidence of benzodiazepine receptor heterogeneity. Regan JW, et al. **Mol Pharmacol** 1981 Nov;20(3):477–83

Effects of intraventricular gamma-acetylenic-GABA on GABA concentrations, GABA-T and GAD in several areas of the chick brain. Nisticò G, et al. **Monogr Neural Sci** 1981;5:34–9

Vertical organization of neurones accumulating 3H-GABA in visual cortex of rhesus monkey. Somogyi P, et al. **Nature** 1981 Dec 24; 294(5843):761–3

GABA-ergic mechanisms in central respiratory control in the anesthetized rat. Hedner J, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981; 317(4):315–20

Gaba induced excitatory responses in the guinea-pig small intestine are antagonized by bicuculline, picrotoxinin and chloride ion blockers. Krantis A, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov; 317(3):257–61

Functional interaction between benzodiazepine and GABA recognition sites in aged rats. Calderini G, et al. **Neurobiol Aging** 1981 Winter; 2(4):309–13

Neurochemical effects of kojic amine, a GABAmimetic and its interaction with benzylamine oxidase. Ferkany JW, et al. **Neuropharmacology** 1981 Dec;20(12A):1177–82

The activity of cis and trans -2- (aminomethyl) cyclopropane carboxylic acids on GABA - related mechanisms in the central nervous system of Limulus and Periplanata and of mammals. Gardner CR, et al. **Neuropharmacology** 1982 Feb;21(2):197–200

Effect of metabolites of valproic acid on the metabolism of GABA in brain and brain nerve endings. Löscher W, et al. **Neuropharmacology** 1981 Dec;20(12A):1187–92

Simultaneous reduction in the turnover rates of septal gamma-aminobutyric acid and hippocampal acetylcholine following administration of nabilone. Revuelta AV, et al. **Neuropharmacology** 1981 Nov;20(11):1111–4

Further evidence for GABA-like action on kojic amine. Martin GE, et al. **Neurosci Lett** 1981 Nov 18;27(1):37–40

Desensitization-like changes in GABA receptor binding of rat fascia dentata after entorhinal lesion. Nadler JV. **Neurosci Lett** 1981 Nov 4; 26(3):275–81

Inhibitory conductance changes and action of gamma-aminobutyrate in rat hippocampus. Ben-Ari Y, et al. **Neuroscience** 1981;6(12):2445–63

Primary monolayer cultures of the rat corpus striatum: morphology and properties related to acetylcholine and gamma-aminobutyrate. Messer A. **Neuroscience** 1981;6(12):2677–87

Decreased uptake of GABA by dorsal ganglia in methylmercury-treated rats. Araki K, et al. **Neurotoxicology (Park Forest II)** 1981 Nov; 2(3):557–66

The effects of acute administration of diazepam on the binding of [3H]-diazepam and [3H]-gaba to rat cortical membranes. Coupet J, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):965–8

gamma-Aminobutyric acid in brain areas of isolated aggressive or non-aggressive inbred strains of mice. Simler S, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):57–61

Evidence of a role for GABA in benzodiazepine effects on food preference in rats. Hodges HM, et al. **Psychopharmacology (Berlin)** 1981; 75(3):305–10

Gnawing and changes in reactivity produced by microinjections of picrotoxin into the superior colliculus of rats. Redgrave P, et al. **Psychopharmacology (Berlin)** 1981;75(2):198–203

Involvement of GABA in ganglion cell receptive field organization in the frog retina. Bonaventure N, et al. **Vision Res** 1981;21(11):1653–5

Effect of synaptic transmitter drugs on receptive fields of rabbit retinal ganglion cells. Daw NW, et al. **Vision Res** 1981;21(11):1643–7

[The effects of phenobarbitone on the inhibitory action of GABA (author's transl)] Kaneko S, et al. **No To Shinkei** 1982 Jan;34(1):77–84 (Eng. Abstr.) **(Jpn)**

[Effect of GABA on motor activity in the rat during the early postnatal period] Malakhovskaia DB, et al. **Zh Vyssh Nerv Deiat** 1982 Jan–Feb; 32(1):115–21 (Eng. Abstr.) **(Rus)**

GLUCURONIDASE

The beta-glucuronidase catalyzed hydrolysis of a glucopyranosiduronamide and a glucopyranoside: evidence for the oxocarbonium ion mechanism for bovine liver beta-glucuronidase. Parker A, et al. **Biochem Biophys Res Commun** 1981 Dec 31; 103(4):1390–4

Sequential hydrolysis of hyaluronate by beta-glucuronidase and beta-N-acetylhexosaminidase. Longas MO, et al. **Biochem J** 1981 Aug 1;197(2):275–82

O-and C-D-glucosyluronic acid derivatives of delta 1-tetrahydrocannabinol: synthesis and differential behavior to beta-glucuronidase. Zehavi U, et al. **Carbohydr Res** 1981 Dec 1; 98(1):143–7

Morphine glucuronide hydrolysis: superiority of beta-glucuronidase from Patella vulgata. Combie J, et al. **Clin Chem** 1982 Jan;28(1):83–6

The antiandrogenic action of gonadotropin-releasing hormone and its agonists on the mouse kidney. Lecomte P, et al. **Endocrinology** 1982 Jan;110(1):1–6

Studies on the possible involvement of complement component C3 in the initiation of acid hydrolase secretion by macrophages. Riches DW, et al. **Immunology** 1982 Mar;45(3):473–81

The selective polymorphonuclear neutrophils (PMN) degranulation as the probable additional mechanism of the hemodialysis (HD)-induced complement activation. Wysocki H, et al. **Int J Artif Organs** 1981 Jul; 4(4):174–7

Separation and properties of two enzyme forms of beta-glucuronidase from the mollusc Helicella ericetorum. Reglero A, et al. **Int J Biochem** 1981;13(11):1185–9

Cloning and endonuclease restriction analysis of uidA and uidR genes in Escherichia coli K-12: determination of transcription direction for the uidA gene. Blanco C, et al. **J Bacteriol** 1982 Feb;149(2):587–94

Reactivity of epidermal Langerhans cells to a histochemical method for demonstration of beta-glucuronidase. Mackenzie IC, et al. **J Invest Dermatol** 1982 Mar;78(3):239–42

Acid mucopolysaccharide and one of its glomerular degrading enzymes beta-glucuronidase in experimental and human glomerulonephritis. Matsuo E, et al. **Renal Physiol** 1980;3(1–6):97–105

GONADOTROPINS, PITUITARY

Ultrastructural evidence of gonadotrophin release from castration cells following injection of LHRH in the rat. Shiino M. **Cell Tissue Res** 1982 Jan;222(1):213–22

Effect of oestrogen on gonadotrophin release in stumptailed monkeys (Macaca arctoides) treated chronically with an agonist analogue of luteinizing hormone releasing hormone Fraser HM. **J Endocrinol** 1981 Dec;91(3):525–30

Effect of passive immunization against LH-RH on gonadotropin secretion in the ferret. Gledhill B, et al. **J Reprod Fertil** 1982 Jan;64(1):19–23

GUANETHIDINE

Impairment of trophic response of brown fat to cold in guanethidine-treated rats. Mory G, et al. **Am J Physiol** 1982 Mar; 242(3):C159–65

Comparative studies of (—)-, (+/-)-propranolol, atenolol, guanethidine, bretylium and tetracaine on adrenergic transmission. Kaiho M, et al. **Br J Pharmacol** 1981 Oct;74(2):365–70

Effect of an amnesic dose of reserpine, syrosingopine or guanethidine on the levels of whole brain dopamine and norepinephrine in the mouse. Brown OM, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):911–4

HABITUATION (PSYCHOPHYSIOLOGY)

Enhanced responsiveness of alpha-noradrenergic receptors following discrete electrolytic lesions of the nucleus locus coeruleus: a behavioral demonstration. De Carvalho LP, et al. **J Neural Transm** 1982; 53(1):23-37

HALOPERIDOL

Stability of haloperidol in 5% dextrose injection. Das Gupta V, et al. **Am J Hosp Pharm** 1982 Feb;39(2):292-4

Physostigmine and haloperidol treatment of acute phencyclidine intoxication. Castellani S, et al. **Am J Psychiatry** 1982 Apr; 139(4):508-10

Unintentional haloperidol abuse [letter] Jack RA. **Am J Psychiatry** 1982 Feb;139(2):258

Questions about combined lithium and haloperidol treatment [letter] Rudorfer MV, et al. **Am J Psychiatry** 1982 Apr;139(4):537-8

High doses of haloperidol in schizophrenia. A clinical, biochemical, and pharmacokinetic study. Zarifian E, et al. **Arch Gen Psychiatry** 1982 Feb; 39(2):212-5

Subsensitivity of the presynaptic dopamine receptors in cat heart after the termination of chronic haloperidol treatment. Verimer T, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):233-40

Effect of haloperidol on adrenal ornithine decarboxylase activity of the rat. Almazan G, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):131-6

Long-term effects of nigro-striatal denervation of striatal [3H]haloperidol binding. Feuerstein C, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):457-60

Lithium dissociates haloperidol-induced behavioral supersensitivity from reduced dopac increase in rat striatum. Meller E, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):25-9

Treatment of pregnant rats with haloperidol delays the onset of sexual maturation in female offspring. Bhanot R, et al. **Experientia** 1982 Jan 15;38(1):137-9

The haloperidol effect on the histofluorescence in the caudate nucleus of the rat brain treated with agonistic and antagonistic acetylcholine compounds. Wawrzyniak M, et al. **Folia Histochem Cytochem (Krakow)** 1981;19(3):143-8

Interaction of antacids with psychotropics. Goldstein BJ. **Hosp Community Psychiatry** 1982 Feb;33(2):96

Haloperidol concentrations in saliva and serum: determination by the radioimmunoassay method. Yamazumi S, et al. **Int Pharmacopsychiatry** 1981;16(3):174-83

Measurement of haloperidol in human plasma using reversed-phase high-performance liquid chromatography. Jatlow PI, et al. **J Chromatogr** 1982 Jan 8;227(1):233-8

Comparative effects of chronic haloperidol and sulpiride treatment on nigral and striatal GABA content. Nicoletti F, et al. **J Neurochem** 1981 Oct;37(4):1048-51

GLC determination of bromperidol in tablets. Martin RP, et al. **J Pharm Sci** 1982 Jan;71(1):112-4

Chronic treatment with haloperidol or fluphenazine decanoate: regional effects on dopamine and serotonin metabolism in primate brain. Bacopoulos NG, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):22-8

Haloperidol pharmacokinetics: a preliminary study in rhesus monkeys using a new radioimmunoassay procedure. Stafford JE, et al. **J Pharmacol Methods** 1981 Dec;6(4):261-79

Chronic haloperidol treatment increased calcium-dependent phosphorylation in rat striatum. Lau YS, et al. **Life Sci** 1982 Jan 4; 30(1):21-8

Unique response to antipsychotic drugs is due to absence of terminal autoreceptors in mesocortical dopamine neurones. Bannon MJ, et al. **Nature** 1982 Apr 1;296(5856):444-6

Differential time- and dose-dependent effects in the haloperidol blockade of luteinizing hormone release and ovulation. Krieg RJ Jr, et al. **Neuroendocrinology** 1981 Dec;33(6):372-5

Chronic electroconvulsive shock and chronic haloperidol administration are not additive in effects on dopamine receptors. Globus M, et al. **Neuropharmacology** 1981 Nov;20(11):1125-8

Effects of acute and chronic haloperidol treatment on the concentrations of immunoreactive beta-endorphin in plasma, pituitary and brain of rats. Höllt V, et al. **Neuropharmacology** 1982 Feb;21(2):147-54

Substance P levels in the rat forebrain after apomorphine and haloperidol treatment. Janicki P, et al. **Pol J Pharmacol Pharm** 1981; 33(5):499-502

Red blood cell/plasma haloperidol ratios and antipsychotic efficacy [letter] Neborsky RJ, et al. **Psychiatry Res** 1982 Feb;6(1):123-4

Antiemetic effect of haloperidol in the dog as related to plasma level and dose. Niemegeers CJ, et al. **Psychopharmacology (Berlin)** 1981; 75(3):240-4

Haloperidol and clonidine increase, and apomorphine decreases ultrasonic vocalizations by gerbils. Thiessen DD, et al. **Psychopharmacology (Berlin)** 1981;75(3):287-90

[Effect of phenamine and haloperidol on stereotyped behavior in response to electric stimulation of the substantia nigra in cats] Arushanian EB, et al. **Biull Eksp Biol Med** 1981 Oct;91(10):444-7 (Eng. Abstr.) (Rus)

HEXOBARBITAL

Induction of hexobarbital and antipyrine metabolism by rifampicin treatment in the pig. van den Broek JM, et al. **Drug Metab Dispos** 1981 Nov-Dec;9(6):541-4

HISTAMINE

On the interaction of histamine with the tryptaminergic smooth-muscle receptors. Todorov S, et al. **Acta Physiol Pharmacol Bulg** 1980; 6(4):47-54

Histamine, cAMP, and activation of piglet gastric mucosa. Machen TE, et al. **Am J Physiol** 1982 Feb;242(2):G79-84

The influence of some cardiodepressant drugs on the histamine-induced restoration of contractility in potassium-depolarized heart preparations. Mantelli L, et al. **Arch Int Pharmacodyn Ther** 1981 Nov; 254(1):99-108

Chemoreceptors for serotonin (5-HT), acetylcholine (ACh), bradykinin (BK), histamine (H) and gamma-aminobutyric acid (GABA) on rabbit visceral afferent neurons. Higashi H, et al. **Brain Res Bull** 1982 Jan; 8(1):23-32

Histamine synthesis by intact mast cells from canine fundic mucosa and liver. Beaven MA, et al. **Gastroenterology** 1982 Feb;82(2):254-62

Histamine concentration and its effect on ovarian contractility in humans. Morikawa H, et al. **Int J Fertil** 1981;26(4):283-6

Pharmacology of arterioles: some aspects of variability in response to norepinephrine, histamine, and 5-hydroxytryptamine. Burrows ME, et al. **J Cardiovasc Pharmacol** 1981 Nov-Dec;3(6):1370-80

Histamine: correlative studies in nucleus accumbens. Chronister RB, et al. **J Neurobiol** 1982 Jan;13(1):23-37

Studies on isolated smooth muscle cells. VII. Response to agonists and the contraction velocity of taenia coli of guinea pig and the single smooth muscle cells. Momose K, et al. **J Pharmacobiodyn** 1981 Sep; 4(9):670-6

Use of 125I-labeled human serum albumin for quantitation of microvascular permeability in rat skin: reevaluation of an old method for studies on substances with an enhancing effect on microvascular permeability. Gerdin B. **J Pharmacol Methods** 1981 Nov;6(3):167-75

Serum concentration of pancreatic polypeptide after infusion of histamine and the effect of cimetidine, trimipramine, and atropine in man. Flaten O, et al. **Scand J Gastroenterol** 1981;16(8):989-91

[Effects of cigarette smoking on pulmonary functions and on plasma levels of serotonin, histamine and serum angiotensin I converting enzyme activity (author's transl)] Ishihara Y, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1981 Oct;19(10):721-7 (Eng. Abstr.) (Jpn)

[Serotonin and histamine liberation in experimental skin wounds] Lipshits RU, et al. **Fiziol Zh** 1982 Jan-Feb;28(1):107-9 (Rus)

[Study of serotonin and histamine metabolism in cosmonauts] Dolgun ZS, et al. **Kosm Biol Aviakosm Med** 1982 Jan-Feb;16(1):89-91 (Rus)

[Fluorimetric determination of serotonin and histamine in one sample] Sominskiĭ VN, et al. **Lab Delo** 1982;(2):104-7 (Eng. Abstr.) (Rus)

HUNGER

Amygdalar noradrenergic and dopaminergic mechanisms in the regulation of hunger and thirst-motivated behavior. Lénárd L, et al. **Brain Res** 1982 Feb 4;233(1):115-32

HYDANTOINS

Biopharmaceutical studies on hydantoin derivatives. I. Physico-chemical properties of hydantoin derivatives and their intestinal absorption. Fujioka H, et al. **J Pharmacobiodyn** 1981 Oct;4(10):759-70

Relation of in vivo drug metabolism to stereoselective fetal hydantoin toxicology in mouse: evaluation of mephenytoin and its metabolite, nirvanol. Wells PG, et al. **J Pharmacol Exp Ther** 1982 Apr; 221(1):228-34

HYDRAZINES

Chemical modification of peptides by hydrazine. Honegger A, et al. **Biochem J** 1981 Oct 1;199(1):53-9

Temperature effects on hydraziine toxicity to bluegills. Hunt TP, et al. **Bull Environ Contam Toxicol** 1981 Nov;27(5):588-95

Cerebral protective effect and radical scavenging action. Yasuda H, et al. **J Neurochem** 1981 Oct;37(4):934-8

Metabolic fate of hydrazine. Springer DL, et al. **J Toxicol Environ Health** 1981 Jul-Aug;8(1-2):21-9

Blockade of 5-HTp reduction of ethanol drinking with the decarboxylase inhibitor, ro 4-4602. Geller I, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):871-4

[Antiestrogens and antiandrogens based on acylhydrazines] Tret'iakov AV. **Dokl Akad Nauk SSSR** 1981;261(1):247-51 (Rus)

[Hydrazine derivative modification of the activity of brain mitochondrial monoamine oxidases] Kalninia IE, et al. **Vopr Med Khim** 1981 Nov-Dec;

27(6):773-9 (Eng. Abstr.) (Rus)

HYDRAZONES

Studies on benzhydrazone, a specific inhibitor of herpesvirus glycoprotein synthesis. Size distribution of glycopeptides and endo-beta-N-acetylglucosaminidase-H treatment. Serafini-Cessi F, et al. **Arch Virol** 1981;70(4):331-43

HYDROXYBUTYRATES

Cellular glycogen, beta-1,2,-glucan, poly beta-hydroxybutyric acid and extracellular polysaccharides in fast-growing species of Rhizobium. Zevenhuizen LP. **Antonie Van Leeuwenhoek** 1981;47(6):481-97

Mapping of a new pan mutation in Escherichia coli K-12. Manch JN. **Can J Microbiol** 1981 Nov;27(11):1231-3

Effects of anticonvulsants on the formation of gamma-hydroxybutyrate from gamma-aminobutyrate in rat brain. Whittle SR, et al. **J Neurochem** 1982 Mar;38(3):848-51

[The effects of butoctamide hydrogen succinate (BAHS) on the sleep of the aged people (author's transl)] Hayashi Y, et al. **No To Shinkei** 1981 Dec;33(12):1243-50 (Eng. Abstr.) (Jpn)

[Effect of hydrocortisone on the respiration of rat cerebral cortex slices in media containing pyruvic or beta-hydroxybutyric acid] Emel'ianov NA, et al. **Fiziol Zh SSSR** 1981 Oct;67(10):1468-71 (Eng. Abstr.) (Rus)

[Changes in the 11-hydroxycorticosteroid content of patients receiving droperidol and sodium oxybutyrate and undergoing electrostimulation] Sergeenko NI, et al. **Vestn Khir** 1981 Nov;127(11):114-6 (Rus)

HYDROXYDOPAMINES

The structure of cerebral cortex in the rat following prenatal administration of 6-hydroxydopamine. Lidov HG, et al. **Brain Res** 1982 Jan;255(1):81-108

Further studies on the effects of intravenously administered 6-hydroxydopamine on the median eminence of the rat. Smith GC, et al. **Brain Res** 1982 Feb 18;234(1):101-10

Selective chemical hepatic sympathectomy in the dog. Allman FD, et al. **Crit Care Med** 1982 Feb;10(2):100-3

Ultrastructural changes after intracisternal injection of 6-hydroxydopamine in the intermediolateral nucleus of the monkey (Macaca fascicularis). Wong WC, et al. **J Anat** 1981 Oct;133(Pt 3):321-31

Experimental studies on cerebellar foliation. II. A morphometric analysis of cerebellar fissuration defects and growth retardation after neonatal treatment with 6-OHDA in the rat. Allen C, et al. **J Comp Neurol** 1981 Dec 20;203(4):771-83

Experimental studies on cerebellar foliation. I. A qualitative morphological analysis of cerebellar fissuration defects after neonatal treatment with 6-OHDA in the rat. Sievers J, et al. **J Comp Neurol** 1981 Dec 20;203(4):751-69

Drug-induced circling after unilateral 6-hydroxydopamine lesions of the nigro-striatal pathway is mediated via the midbrain periaqueductal grey and adjacent reticular formation (angular complex). Reavill C, et al. **Life Sci** 1981 Dec 7;29(23):2357-65

6-Hydroxydopamine decreases benzodiazepine but not GABA receptor binding in rat cerebellum. Doble A, et al. **Neurosci Lett** 1981 Dec 11;27(2):199-204

Effects of 5,7-dihydroxytryptamine and 6-hydroxydopamine on fever response in conscious rats. Matuszek M, et al. **Pol J Pharmacol Pharm** 1981;33(3):305-12

Collicular picrotoxin alleviates akinesia but not sensory neglect in rats with bilateral 6-hydroxydopamine lesions of ventral midbrain. Redgrave P, et al. **Psychopharmacology (Berlin)** 1981;75(2):204-9

HYDROXYINDOLEACETIC ACID

Determination of 5-hydroxytryptophan, serotonin and 5-hydroxyindoleacetic acid in rat and human brain and biological fluids by reversed-phase high-performance liquid chromatography with electrochemical detection. Semerdjian-Rouquier L, et al. **J Chromatogr** 1981 Nov 20;218:663-70

Simultaneous determination of serotonin, 5-hydroxindoleacetic acid, 3,4-dihydroxyphenylacetic acid and homovanillic acid by high performance liquid chromatography with electrochemical detection. Sperk G. **J Neurochem** 1982 Mar;38(3):840-3

Gradients of monoamine metabolites and cortisol in cerebrospinal fluid of psychiatric patients and healthy controls. Bertilsson L, et al. **Psychiatry Res** 1982 Feb;6(1):77-83

[5-Hydroxyindoleacetic acid excretion in patients with the glossalgia syndrome] Dychko EN, et al. **Stomatologiia (Mosk)** 1982 Jan-Feb;61(1):34-5 (Eng. Abstr.) (Rus)

HYDROXYTRYPTOPHAN

Plasma accumulation of metabolism of orally administered single dose L-5-hydroxytryptophan in man. Magnussen I, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):184-9

Comparison of the cardiovascular responses to intracerebroventricular administration of tryptamine, 5-hydroxytryptamine, tryptophan and 5-hydroxytryptophan in rats. Krstić MK, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):385-91

Contrasting effects of clonidine and 5-hydroxytryptophan on spinal sympathetic pathways. Madsen PW, et al. **Clin Exp Hypertens** 1981;3(6):1151-63

Determination of 5-hydroxytryptophan, serotonin and 5-hydroxyindoleacetic acid in rat and human brain and biological fluids by reversed-phase high-performance liquid chromatography with electrochemical detection. Semerdjian-Rouquier L, et al. **J Chromatogr** 1981 Nov 20;218:663-70

Long-term infusion of L-5-hydroxytryptophan increases brain serotonin turnover and decreases blood pressure in normotensive rats. Echizen H, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):579-84

Evidence that the effects of 5-hydroxytryptophan on the secretion of ACTH and growth hormone in dogs are not mediated by central release of serotonin. Zimmermann H, et al. **Neuroendocrinology** 1982 Jan;34(1):27-31

Antagonism by methysergide of the effects of L-5-hydroxytryptophan and quipazine on schedule-controlled responding. Leander JD. **Neuropharmacology** 1981 Dec;20(12A):1141-3

Blockade of 5-HTp reduction of ethanol drinking with the decarboxylase inhibitor, ro 4-4602. Geller I, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):871-4

HYPERKINESIS

Growth hormone and prolactin secretion in adults and hyperactive children: relation to methylphenidate serum levels. Gualtieri CT, et al. **Psychoneuroendocrinology** 1981 Dec;6(4):331-9

[Effect of alpua-methyl-para-tyrosine on 'methamphetamine-induced sterotype and hypermotility' of reserpinized rats (author's transl)] Nakajima H, et al. **Nippon Yakurigaku Zasshi** 1981 Dec;78(6):557-69 (Eng. Abstr.) (Jpn)

HYPERKINETIC SYNDROME

Effects of d-amphetamine on urinary metabolites of dopamine and norepinephrine in hyperactive boys. Shekim WO, et al. **Am J Psychiatry** 1982 Apr;139(4):485-8

Food additives and developmental disorders: the case of erythrosin (FD&C Red 3), or guilty until proven innocent? Mailman RB, et al. **Appl Res Ment Retard** 1981;2(4):297-305

The use of psychopharmacology to study reciprocal influences in parent-child interaction. Barkley RA. **J Abnorm Child Psychol** 1981 Sep;9(3):303-10

A four-year follow-up study of the effects of methylphenidate on the behavior and academic achievement of hyperactive children. Charles L, et al. **J Abnorm Child Psychol** 1981 Dec;9(4):495-505

Medication effects in the classroom: three naturalistic indicators. Whalen CK, et al. **J Abnorm Child Psychol** 1981 Dec;9(4):419-33

Methylphenidate compared with behavioral self-control in attention deficit disorder: preliminary report. Anderson EE, et al. **JDBP** 1981 Dec;2(4):137-41

Effects of levodopa on attention deficit disorder, residual type. Wood D, et al. **Psychiatry Res** 1982 Feb;6(1):13-20

IMIPRAMINE

The effects of imipramine on socio-emotional and alimentary motivated behavior in dogs. Zagrodzka J, et al. **Acta Neurobiol Exp (Warsz)** 1981;41(4):363-72

Relationship between plasma antidepressant levels and clinical outcome for inpatients receiving imipramine. Simpson GM, et al. **Am J Psychiatry** 1982 Mar;139(3):358-60

Plasma imipramine concentrations in patients receiving concomitant fluphenazine decanoate. Siris SG, et al. **Am J Psychiatry** 1982 Jan;139(1):104-6

Steady-state plasma imipramine levels in prepubertal depressed children. Weller EB, et al. **Am J Psychiatry** 1982 Apr;139(4):506-8

Level of ego development and psychotherapy outcome in phobic patients. Rock MH, et al. **Br J Med Psychol** 1981 Dec;54(Pt 4):319-28

Active metabolites of imipramine and desipramine in man. Potter WZ, et al. **Clin Pharmacol Ther** 1982 Mar;31(3):393-401

Decreased 3H-imipramine binding in depressed males and females. Asarch KB, et al. **Commun Psychopharmacol** 1980;4(5):425-32

Toward a biochemical classification of depressive disorders IV: Pretreatment urinary MHPG levels as predictors of antidepressant response to imipramine. Schatzberg AF, et al. **Commun Psychopharmacol** 1980;4(5):441-5

Autoradiographic localization of imipramine binding in rat brain. Rainbow TC, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):363-4

Changes in saliva secretion and accommodation width during short-term administration of imipramine and zimelidine in healthy volunteers. von Knorring L. **Int Pharmacopsychiatry** 1981;16(2):69-78

Viloxazine HCl in the treatment of endogenous depression: a standard (imipramine) controlled clinical study. McEvoy JP, et al. **J Clin Psychiatry** 1981 Mar;43(3):111–2

Maprotiline versus imipramine [letter] Rifkin A. **J Clin Psychiatry** 1981 Mar;43(3):122

The influence of amitriptyline, imipramine and chlorpromazine on activity of arginase in rat's brain and liver. Grabowska-Hibner J, et al. **Mater Med Pol** 1981 Jan–Mar;13(1):54–7

Cerebral pharmacokinetics of imipramine in rats after single and multiple dosages. Daniel W, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):209–13

3H-Imipramine binding sites in the rat brain. Selective localization on serotoninergic neurones. Gross G, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981;317(4):310–4 ·

Beta-adrenergic receptors in rat cerebellum after neonatal X-irradiation: effect of prolonged imipramine and lithium treatment. Türck M, et al. **Neurosci Lett** 1981 Dec 23;27(3):357–62

Human platelet imipramine recognition sites: biochemical and pharmacological characterization. Wennogle LP, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):975–82

High-affinity 3H-imipramine binding: a new biological marker in depression. Langer SZ, et al. **Pharmacopsychiatria** 1982 Jan; 15(1):4–10 (57 ref.)

A comparison of plasma and serum levels of two tricyclic antidepressants: imipramine and desipramine. Saady JJ, et al. **Psychopharmacology (Berlin)** 1981;75(2):173–4

Different synaptic location of mianserin and imipramine binding sites. Brunello N, et al. **Science** 1982 Feb 26;215(4536):1112–5

ISOCARBOXAZID

Monoamine oxidase inhibitor-responsive depression. Giller E, et al. **Psychiatry Res** 1982 Feb;6(1):41–8

LACTATES

Oxygen dependence of dopamine-beta-hydoxylase activity and lactate metabolism in synaptosomes from rat brain. Katz IR. **Brain Res** 1982 Jan 14;231(2):399–409

Steroidogenic and glycolytic responses to nucleotides, nucleosides and steroids in rodent adrenal glands: opposing, species-dependent effects of cyclic GMP. Hum WT, et al. **J Endocrinol** 1981 Dec; 91(3):447–56

Comparative utilization of the isomers of phenylalanine and phenyllactic acid by chicks and rats. Boebel KP, et al. **J Nutr** 1982 Feb; 112(2):367–76

[The aerobic and anaerobic capacity of adolescents and catecholamine excretion during prolonged submaximal exercise (author's transl)] Lehmann M, et al. **Eur J Applied Physiol** 1982;48(1):135–45 (Eng. Abstr.) **(Ger)**

LEARNING

An attempt to use central dopaminergic stimulation as a reinforcement for T-maze learning in rats. Jurkowlaniec E, et al. **Acta Neurobiol Exp (Warsz)** 1981;41(4):357–62

Behavioral and neurochemical changes in rats simultaneously exposed to manganese and lead. Chandra AV, et al. **Arch Toxicol** 1981 NOV; 49(1):49–56

Time-dependent environmentally-induced changes in cerebral and extra-cerebral morphology and chemistry--the basis of learning, memory and behavior. DeFeudis FV. **Gen Pharmacol** 1982;13(1):1–9 (97 ref.)

Selective associations in one-day-old rats: taste-toxicosis and texture-shock aversion learning. Gemberling GA, et al. **J Comp Physiol Psychol** 1982 Feb;96(1):105–13

[Duration of the normalizing effect of substance P in disturbances of the learning process after long-term exposure to noise] Hecht K, et al. **Pharmazie** 1981 Dec;36(12):859–60 **(Ger)**

LEARNING DISORDERS

DOes the child with a learning disability have a biochemical defect? Leary PM. **S Afr Med J** 1982 Jan 2;61(1):14–6

LEVODOPA

Study of the neural basis of circling behavior induced by L-dopa in lesioned entopeduncular cats. Pazo JH, et al. **Brain Res** 1982 Feb 11; 233(2):337–45

The regulation of striatal DOPA synthesis by alpha 2-adrenoreceptors. Rabey JM, et al. **Brain Res** 1981 Dec 28;230(1–2):422–6

Inhibition of reverse transcriptase by tyrosinase generated quinones related to levodopa and dopamine. Wick MM, et al. **Chem Biol Interact** 1981 Dec;38(1):99–107

Suppressive action of cholecystokinin octapeptide on the behavioral effects of L-DOPA in the rat. Itoh S, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):313–6

Levodopa and aspirin pretreatment beneficial in experimental decompression sickness. Popovic P, et al. **Proc Soc Exp Biol Med** 1982 Jan;169(1):140–3

Effects of levodopa on attention deficit disorder, residual type. Wood D, et al. **Psychiatry Res** 1982 Feb;6(1):13–20

LH

Gonadotrophin releasing hormone causes a biphasic secretion of luteinizing hormone and follicle stimulating hormone by cultures of rat anterior pituitary cells. Eddie LW, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):44–9

Long-lasting desensitizing effect of short-term LRH exposure on the pituitary responsiveness to LRH in the ovariectomized rat. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):200–5

Kinetics of LRH-induced LH-release in vivo: influence of LRH pre-treatment. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):195–9

Short-term kinetics of LRH-induced LH-release in the long-term ovariectomized rat. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):187–94

Release of LH in vitro from anterior pituitary glands of ovariectomized rats by LRH or elevated potassium concentration after pre-treatment with oestradiol benzoate in vivo. Tijssen AM, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):206–10

Electrophysiologic correlates of steroid modulation of luteinizing hormone release. Leung PC, et al. **Am J Physiol** 1982 Mar; 242(3):E164–70

Immunohistochemical study of the responsiveness of LH cells of fetal rats to synthetic LHRH in vitro. Watanabe YG. **Cell Tissue Res** 1981; 221(1):59–66

The role of catecholamines in the regulation of pituitary luteinizing hormone and follicle-stimulating hormone secretion. Barraclough CA, et al. **Endocr Rev** 1982 Winter;3(1):91–119 (268 ref.)

Intraventricular injection of follicle-stimulating hormone (FSH) during proestrus stimulates the rise in serum FSH on estrus in phenobarbital-treated hamsters through a central nervous system-dependent mechanism. Coutifaris C, et al. **Endocrinology** 1982 Jan;110(1):105–13

Evidence for the involvement of central epinephrine systems in the regulation of luteinizing hormone, prolactin, and growth hormone release in female rats. Crowley WR, et al. **Endocrinology** 1982 Apr; 110(4):1102–7

Melatonin directly inhibits rat gonadotroph cells. Martin JE, et al. **Endocrinology** 1982 Apr;110(4):1079–84

Ovarian steroids modulate the self-priming effect of luteinizing hormone-releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **Endocrinology** 1982 Mar;110(3):717–21

Catecholestrogens and release of anterior pituitary gland hormones. I. Luteinizing hormone. Rodriguez-Sierra JF, et al. **Endocrinology** 1982 Feb;110(2):318–24

Study of the direct action of luteinizing hormone-releasing hormone agonists at the testicular level in intact rats treated with an antiluteinizing hormone serum. Séguin C, et al. **Endocrinology** 1982 Feb; 110(2):524–30

Effect of pulsatile gonadotropin-releasing hormone on the release of luteinizing hormone and follicle-stimulating hormone in vitro by anterior pituitaries from lactating and cycling rats. Smith MS. **Endocrinology** 1982 Mar;110(3):882–91

Regulation of tonic gonadotropin release in prepubertal female hamsters. Smith SG 3d, et al. **Endocrinology** 1982 Apr;110(4):1262–7

A puberty-related attenuation of opiate peptide-induced inhibition of LH secretion. Wilkinson M, et al. **Endocrinology** 1982 Mar;110(3):1046–8

Adaptation of the pituitary gland to prolonged LRH stimulation. Koiter TR, et al. **Experientia** 1981 Dec 15;37(12):1349–51

Differential effects of bromocriptine treatment on LH release and copulatory behavior in hyperprolactinemic male rats. Doherty PC, et al. **Horm Behav** 1981 Dec;15(4):436–50

Basal and GnRH-induced release and synthesis of LH and FSH from incubated pituitary glands throughout the 4-day estrous cycle of the rat. Apfelbaum ME. **Horm Res** 1981;15(2):109–21

Further studies of the effects of intravenous infusion or intramuscular injection of gonadotropin-releasing hormone during childhood and adolescence. Reiter EO, et al. **J Adolesc Health Care** 1981 Jun; 1(4):275–81

Diminution of the in vitro response to luteinizing hormone by corpora lutea induced by gonadotropin releasing hormone treatment of postpartum suckled beef cows. Kesler DJ, et al. **J Anim Sci** 1981 Sep; 53(3):749–54

Effects of porcine follicular fluid on gonadotropin concentrations in rhesus monkeys. Rettori V, et al. **J Clin Endocrinol Metab** 1982 Mar; 54(3):500–3

Effects of an intermittent lighting schedule on the time of egg-laying and the levels of luteinizing hormone, progesterone and corticosterone in the plasma of the domestic hen. Duplaix M, et al. **J Endocrinol** 1981 Dec;91(3):375–83

Drug-induced hyperprolactinaemia and discharges of luteinizing hormone voked by oestrogen in ovariectomized rhesus monkeys. Martensz ND, et al. **J Endocrinol** 1982 Jan;92(1):111-22

Effect of cortisol or adrenocorticotrophin on release of luteinizing hormone induced by luteinizing hormone releasing hormone in the diary heifer. Matteri RL, et al. **J Endocrinol** 1982 Jan;92(1):141-6

Effects of LHRH and long-acting LHRH on serum LH and FSH levels of healthy women. Bartfai G, et al. **J Endocrinol Invest** 1981 Jul-Sep; 4(3):359-62

Plasma LH and testosterone responses to synthetic gonadotrophin-releasing hormone (GnRH) or dexamethasone-GnRH combined treatment and their relationship to semen output in bulls. Abdel Malak G, et al. **J Reprod Fertil** 1982 Jan;64(1):107-13

In-vivo and in-vitro effects of domperidone on the release of prolactin and LH in male and female rats. Carter DA, et al. **J Reprod Fertil** 1982 Jan;64(1):191-7

Lack of effect of melatonin on the pituitary response to LH-RH in the ewe. Symons AM, et al. **J Reprod Fertil** 1982 Jan;64(1):103-6

Direct in vitro stimulation of pituitary LH release by alpha melanocyte stimulating hormone. Miyake A, et al. **Life Sci** 1981 Dec 21; 29(25):2637-40

Pituitary cell cultures as a tool for the studies on the GnRH-induced release and biosynthesis of gonadotropins. Jutisz M, et al. **Mater Med Pol** 1980 Jan-Jun;12(1-2):53-62

Patterns of pituitary LH release during sustained stimulation by synthetic LED in cycling female rats. Lu KH, et al. **Mater Med Pol** 1980 Jan-Jun; 12(1-2):63-9

Effects of aging on the activity of hypothalamic dopamine-beta-hydroxylase during various stages of the estrous cycle in C57BL/6 mice. Banerji TK, et al. **Neuroendocrinology** 1982 Jan; 34(1):14-9

Differential effects of low serum levels of estradiol-17 beta on hypothalamic LHRH levels and LH secretion in castrated male rats. Kalra PS, et al. **Neuroendocrinology** 1981 Dec;33(6):340-6

Differential time- and dose-dependent effects in the haloperidol blockade of luteinizing hormone release and ovulation. Krieg RJ Jr, et al. **Neuroendocrinology** 1981 Dec;33(6):372-5

Influence of adrenocorticotropin and adrenalectomy on gonadotropin secretion in immature rats. Mann DR, et al. **Neuroendocrinology** 1982 Jan;34(1):20-6

Role of the dopaminergic system in luteinizing hormone release and ovulation in the hen. Johnson PA, et al. **Poult Sci** 1981 Nov; 60(11):2551-6

Neurotensin inhibits LH release. Motta M, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):62-4

Effects of hypothalamic arcuate nucleus lesions on pulsatile luteinizing hormone concentration in ovariectomized rats. Sridaran R, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):38-44

[Neural origin and modulation by hypothalamic catecholamines of pulsatile secretion of luteinizing hormone in ovariectomized rats (author's transl)] Endo M. **Hokkaido Igaku Zasshi** 1981 Mar; 56(2):185-98 (Eng. Abstr.) **(Jpn)**

[Studies on the feedback regulation of gonadotropin concentrations in male rats (I). The effects of hypothalamic implantation of testosterone and its metabolites on gonadotropin release in castrated male rats (author's transl)] Noguchi K. **Nippon Naibunpi Gakkai Zasshi** 1981 Aug 20;57(8):1139-47 (Eng. Abstr.) **(Jpn)**

[Role of the hypothalamus in the regulation of luteinizing hormone secretion and in the ovulation process] Przekop F. **Acta Physiol Pol** 1981;32(5 Suppl 23):87-128 (117 ref.) **(Pol)**

[Immunoreactive luteinizing hormone in the CNS and peripheral tissues of hypophysectomized rats] Krivosheev OG, et al. **Probl Endokrinol (Mosk)** 1982 Jan-Feb;28(1):58-64 **(Rus)**

LH-FSH RELEASING HORMONE

Short-term kinetics of LRH-induced LH-release in the long-term ovariectomized rat. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):187-94

Pattern of prolactin secretion and pituitary responsiveness to LRH in pseudopregnant rats maintained in constant light. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):31-8

Long-lasting desensitizing effect of short-term LRH exposure on the pituitary responsiveness to LRH in the ovariectomized rat. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):200-5

Kinetics of LRH-induced LH-release in vivo: influence of LRH pre-treatment. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):195-9

Release of LH in vitro from anterior pituitary glands of ovariectomized rats by LRH or elevated potassium concentration after pre-treatment with oestradiol benzoate in vivo. Tijssen AM, et al. **Acta Endocrinol (Copenh)** 1982 Feb;99(2):206-10

LH-RH induced changes in cAMP content of the anterior pituitary gland in male and female rats in vivo and in vitro. Szabó G, et al. **Acta Physiol Acad Sci Hung** 1981;57(4):343-53

Chymotryptic-like hydrolysis of luliberin (LH-RF) by an adenohypophyseal enzyme of high molecular weight. Horsthemke B, et al. **Biochem Biophys Res Commun** 1981 Dec 31;103(4):1322-8

Lack of luteolytic effect of D-Trp-6-LH-RH in hypophysectomized rhesus monkeys (Macaca mulatta). Asch RH, et al. **Biol Reprod** 1981 Dec;25(5):963-8

Temporal relationship between the development of the self-priming effect of LHRH and changes in serum concentrations of testosterone and androstenedione during the sexual maturation of the male rat. Nazian SJ. **Biol Reprod** 1981 Dec;25(5):977-82

A new systematic treatment for infertile women with abnormal hormone profiles. Fleming R, et al. **Br J Obstet Gynaecol** 1982 Jan; 89(1):80-3

The luteinizing hormone-releasing hormone (LHRH) system in normal and estrogenized neonatal rats. Elkind-Hirsch K, et al. **Brain Res Bull** 1981 Dec;7(6):645-54

Altered hypothalamic dopamine depletion rate and LHRH content in noncyclic hamsters. Kumar MS, et al. **Brain Res Bull** 1982 Jan; 8(1):33-6

Immunocytochemical distribution of LHRH neurons and processes in the rat: hypothalamic and extrahypothalamic locations. Bennett-Clarke C, et al. **Cell Tissue Res** 1982;221(3):493-504

Immunohistochemical study of the responsiveness of LH cells of fetal rats to synthetic LHRH in vitro. Watanabe YG. **Cell Tissue Res** 1981; 221(1):59-66

Effects of chronic LHRH agonist treatment on the endometrium and ovaries of the stumptailed macaque. Kerr-Wilson RH, et al. **Contraception** 1981 Dec;24(6):647-55

Early follicular phase luteinizing hormone-releasing hormone agonist administration - effects on follicular maturation and corpus luteum function in women. Skarin G, et al. **Contraception** 1982 Jan; 25(1):31-9

Luteinizing hormone-releasing hormone peptidase activities in discrete hypothalamic regions and anterior pituitary of the rat: apparent regulation during the prepubertal period and first estrous cycle at puberty. Advis JP, et al. **Endocrinology** 1982 Apr;110(4):1238-45

Induction of testicular gonadotropin-releasing hormone (GnRH) receptors by GnRH: effects of pituitary hormones and relationship to inhibition of testosterone production. Bourne GA, et al. **Endocrinology** 1982 Mar;110(3):727-33

Copper stimulates the release of luteinizing hormone releasing hormone from isolated hypothalamic granules. Burrows GH, et al. **Endocrinology** 1982 Apr;110(4):1456-8

Stimulation of progesterone and prostaglandin E accumulation by luteinizing hormone-releasing hormone (LHRH) and LHRH analogs in rat granulosa cells. Clark MR. **Endocrinology** 1982 Jan; 110(1):146-52

Hypothalamic regulation of pituitary gonadotropin-releasing hormone receptors: effects of gonadotropin-releasing hormone immunoneutralization. Clayton RN, et al. **Endocrinology** 1982 Apr; 110(4):1116-22

Hypothalamic regulation of pituitary gonadotropin-releasing hormone receptors: effects of hypothalamic lesions and a gonadotropin-releasing hormone antagonist. Clayton RN, et al. **Endocrinology** 1982 Apr; 110(4):1108-15

Pituitary receptor sites for gonadotropin-releasing hormone: effect of castration and substitutive therapy with sex steroids in the male rat. Conne BS, et al. **Endocrinology** 1982 Jan;110(1):70-9

Peptide antagonists of LH-RH: large increases in antiovulatory activities produced by basic D-amino acids in the six position. Coy DH, et al. **Endocrinology** 1982 Apr;110(4):1445-7

A sex difference in the activation of hypothalamic catecholaminergic and luteinizing hormone-releasing hormone peptidergic neurons after acute castration. DePaolo LV, et al. **Endocrinology** 1982 Feb;110(2):531-9

Neonatal monosodium glutamate treatment alters the response of median eminence luteinizing hormone-releasing hormone nerve terminals to potassium and prostaglandin E2. DePaolo LV, et al. **Endocrinology** 1982 Mar;110(3):835-41

Ovulation induced by a gonadotropin releasing hormone analog in hypophysectomized rats involves prostaglandins. Ekholm C, et al. **Endocrinology** 1982 Jan;110(1):288-90

Inhibition of granulosa cell differentiation by gonadotropin-releasing hormone. Knecht M, et al. **Endocrinology** 1982 Mar;110(3):865-72

The antiandrogenic action of gonadotropin-releasing hormone and its agonists on the mouse kidney. Lecomte P, et al. **Endocrinology** 1982 Jan;110(1):1-6

Evidence for involvement of alpha-adrenergic receptors in norepinephrine-induced prostaglandin E2 and luteinizing hormone-releasing hormone release from the median eminence. Ojeda SR, et al. **Endocrinology** 1982 Feb;110(2):409-12

Ovarian steroids modulate the self-priming effect of luteinizing hormone-releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **Endocrinology** 1982 Mar;110(3):717-21

Dependence of pituitary gonadotropin-releasing hormone (GnRH) receptors on GnRH secretion from the hypothalamus. Pieper DR, et al. **Endocrinology** 1982 Mar;110(3):749-53

Study of the direct action of luteinizing hormone-releasing hormone agonists at the testicular level in intact rats treated with an antiluteinizing hormone serum. Séguin C, et al. **Endocrinology** 1982 Feb;

110(2):524-30

Effect of pulsatile gonadotropin-releasing hormone on the release of luteinizing hormone and follicle-stimulating hormone in vitro by anterior pituitaries from lactating and cycling rats. Smith MS. **Endocrinology** 1982 Mar;110(3):882-91

Regulation of tonic gonadotropin release in prepubertal female hamsters. Smith SG 3d, et al. **Endocrinology** 1982 Apr;110(4):1262-7

Inhibition of pituitary-testicular function with [D-Trp6] luteinizing hormone-releasing hormone in rhesus monkeys. Sundaram K, et al. **Endocrinology** 1982 Apr;110(4):1308-14

Adaptation of the pituitary gland to prolonged LRH stimulation. Koiter TR, et al. **Experientia** 1981 Dec 15;37(12):1349-51

The effect of luteinizing hormone-releasing factor and its agonist on cultured human granulosa cells. Casper RF, et al. **Fertil Steril** 1982 Mar;37(3):406-9

Sensitivity of pituitary and corpus luteum responses to single intranasal administration of (D-ser[TBU]6-des-gly-NH2(10)) luteinizing hormone-releasing hormone ethylamide (Buserelin) in normal women. Lemay A, et al. **Fertil Steril** 1982 Feb;37(2):193-200

Induction of luteolysis by luteinizing hormone-releasing factor (LRF) agonist: sensitivity, reproducibility, and reversibility. Sheehan KL, et al. **Fertil Steril** 1982 Feb;37(2):209-12

Basal and GnRH-induced release and synthesis of LH and FSH from incubated pituitary glands throughout the 4-day estrous cycle of the rat. Apfelbaum ME. **Horm Res** 1981;15(2):109-21

Effects of castration, sex steroids, LHRH and glucocorticoids on LHRH binding in the anterior pituitary of male rats. Naess O, et al. **Int J Androl** 1981 Dec;4(6):685-90

Further studies of the effects of intravenous infusion or intramuscular injection of gonadotropin-releasing hormone during childhood and adolescence. Reiter EO, et al. **J Adolesc Health Care** 1981 Jun; 1(4):275-81

Inhibition of human granulosa cell progesterone secretion by a gonadotropin-releasing hormone agonist. Tureck RW, et al. **J Clin Endocrinol Metab** 1982 May;54(5):1078-80

Effect of oestrogen on gonadotrophin release in stumptailed monkeys (Macaca arctoides) treated chronically with an agonist analogue of luteinizing hormone releasing hormone. Fraser HM. **J Endocrinol** 1981 Dec;91(3):525-30

Decapeptide luteinizing hormone releasing hormone in ovine pineal gland. King JA, et al. **J Endocrinol** 1981 Dec;91(3):405-14

Effects of LHRH and long-acting LHRH on serum LH and FSH levels of healthy women. Bartfai G, et al. **J Endocrinol Invest** 1981 Jul-Sep; 4(3):359-62

Immunocytochemical analysis of the rat pineal gland using antisera generated against analogs of luteinizing hormone-releasing hormone (LHRH). Piekut DT, et al. **J Histochem Cytochem** 1982 Feb; 30(2):106-10

Effect of passive immunization against LH-RH on gonadotropin secretion in the ferret. Gledhill B, et al. **J Reprod Fertil** 1982 Jan;64(1):19-23

Lack of effect of melatonin on the pituitary response to LH-RH in the ewe. Symons AM, et al. **J Reprod Fertil** 1982 Jan;64(1):103-6

A direct effect on LHRH on anterior pituitary estrogen receptors in the female rat. Singh P, et al. **J Steroid Biochem** 1982 Jan;16(1):31-7

Recent immunohistological findings on the LH-RH neuron system of the rat. Flerkó B, et al. **Mater Med Pol** 1980 Jan-Jun; 12(1-2):119-23

Pituitary cell cultures as a tool for the studies on the GnRH-induced release and biosynthesis of gonadotropins. Jutisz M, et al. **Mater Med Pol** 1980 Jan-Jun;12(1-2):53-62

Degradation of luteinizing hormone releasing hormone LH-RH by the hypothalamic and pituitary tissue in the presence of its analogs and TRH. Kochman K, et al. **Mater Med Pol** 1980 Jan-Jun; 12(1-2):114-8

Patterns of pituitary LH release during sustained stimulation by synthetic LED in cycling female rats. Lu KH, et al. **Mater Med Pol** 1980 Jan-Jun; 12(1-2):63-9

Occurrence of higher molecular forms cf LHRH in fractionated extracts from rat hypothalamus, cortex and placenta. Gautron JP, et al. **Mol Cell Endocrinol** 1981 Oct;24(1):1-15

Comparison of steroid and LH-RH effects on the responsiveness of hemipituitary glands and dispersed pituitary cells. Speight A, et al. **Mol Cell Endocrinol** 1981 Dec;24(3):267-81

A new class of contraceptives? [news] Fraser HM. **Nature** 1982 Apr 1; 296(5856):391-2

Differential effects of low serum levels of estradiol-17 beta on hypothalamic LHRH levels and LH secretion in castrated male rats. Kalra PS, et al. **Neuroendocrinology** 1981 Dec;33(6):340-6

Presence and localization of immunoreactive luteinizing hormone-releasing hormone (LHRH) within the olfactory bulbs of adult male and female rats. Dluzen DE, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):493-6

The effect of LHRH antagonist analogs and an antibody to LHRH on mating behavior in female rats. Dudley CA, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):393-6

Tritium labeling of gonadotropin releasing hormone in its proline and histidine residues. Klauschenz E, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):445-52

Facilitation of sexual receptivity in the rat by an ovulation-inhibiting analog of LHRH. Zadina JE, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):961-4

Regulation of gonadotropin secretion in the anterior pituitary. Hopkins CR, et al. **Philos Trans R Soc Lond [Biol]** 1981 Dec 18; 296(1080):73-81

Rostral medial preoptic area lesions' influence on female estrous processes and LHRH distribution. Popolow HB, et al. **Physiol Behav** 1981 Nov; 27(5):855-61

Antifertility effects of luteinizing hormone-releasing hormone (LHRH) agonists. Labrie F, et al. **Prog Clin Biol Res** 1981;74:273-91 (70 ref.)

Effects of dibutyryl cAMP, LHRH, and aromatase inhibitor on simultaneous outputs of prostaglandin F2 alpha, and 13,14-dihydro-15-keto-prostaglandin F2 alpha by term placental explants. Haning RV Jr, et al. **Prostaglandins** 1982 Jan;23(1):29-40

Contraception with LHRH agonists, a new physiological approach. Labrie F, et al. **Reproduccion** 1981 Oct-Dec;5(4):229-41 (48 ref.)

Mid-cycle contraception with LHRH in women. Maia H Jr, et al. **Reproduccion** 1981 Oct-Dec;5(4):251-60

[The regulation of the hypothalamo-hypophyso-ovarian fuction during the menstrual cycle in the normal woman. A scheme to explain the coordination and control of the secretion and release of gonadotrophins by LH-RH and oestrogens (author's transl)] Buvat J, et al. **J Gynecol Obstet Biol Reprod (Paris)** 1981;10(5):415-23 (55 ref.) (Eng. Abstr.) (Fre)

[The influence of long-term medication with the LH-RH analogue buserelin on the regulation of the menstrual cycle (author's transl)] Hardt W, et al. **Geburtshilfe Frauenheilkd** 1981 Nov;41(11):791-6 (Eng. Abstr.) (Ger)

[Effects of a GnRH analog (Hoe 766) administered in the puerperium on the fertility of dairy cows] Küpfer U, et al. **Schweiz Arch Tierheilkd** 1981;123(7):355-62 (Eng. Abstr.) (Ger)

[Hypophyseal reaction state during oral contraceptiva (author's transl)] Gitsch E, et al. **Wien Klin Wochenschr** 1981 Oct 16;93(19):599-601 (Eng. Abstr.) (Ger)

[Role of the hypothalamus in the regulation of luteinizing hormone secretion and in the ovulation process] Przekop F. **Acta Physiol Pol** 1981;32(5 Suppl 23):87-128 (117 ref.) (Pol)

[Peptid contraception--new principles for family planning] Nilius SJ. **Lakartidningen** 1981 Aug 19;78(34):2845-8 (Eng. Abstr.) (Swe)

LIPOTROPIN

Effect of beta-lipotropin on aldosterone production in the isolated rat adrenal cell preparation. Washburn DD, et al. **J Clin Endocrinol Metab** 1982 Mar;54(3):613-8

Beta-lipotropin and beta-endorphin in physiological and surgical menopause. Genazzani AR, et al. **J Endocrinol Invest** 1981 Oct-Dec; 4(4):375-8

Plasma opioids in the first hours of life. Facchinetti F, et al. **Pediatr Res** 1982 Feb;16(2):95-8

beta-Endorphin and beta-lipotropin plasma levels in chronic schizophrenia, primary affective disorders and secondary affective disorders. Brambilla F, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):321-30

[Effect of cold stress on the concentrations in the hypothalamus, pituitary, and blood of beta-lipotropin and beta-endorphin in the rabbit] Petraglia F, et al. **Boll Soc Ital Biol Sper** 1981 Sep 30;57(18):1862-8 (Eng. Abstr.) (Ita)

LITHIUM

Comparison of the dosage schedules during the administration of retarded lithium carbonate. Balon R, et al. **Act Nerv Super (Praha)** 1981; 23(4):278-80

Lithium levels in the ejaculate, spermiogram and adjuvant psychopharmacological therapy. Kolomaznik M, et al. **Act Nerv Super (Praha)** 1981;23(4):275-6

Spermiologic findings during longterm lithium therapy. Raboch J Jr, et al. **Act Nerv Super (Praha)** 1981;23(4):274-5

Study of lithium levels in the serum and sex organs of female rats. Suva J, et al. **Act Nerv Super (Praha)** 1981;23(4):280-1

The influence of LiCL on animal halves isolated from ascidian eggs. Ferruzza N, et al. **Acta Embryol Morphol Exp** 1981 Aug;2(1):57-67

Effects of lithium and neuroleptics and combinations of the two on renal function and structure in rats. Christensen S, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):161-7

A comparison between the natriuretic response to potassium in lithium- and amiloride-treated rats. Olesen OV, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 May;48(5):382-9

On the mechanism of inhibition of rat fat cell adenylate cyclase by lithium. Thams P, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 May; 48(5):397-403

Flupenthixol decanoate in recurrent manic–depressive illness. A comparison with lithium. Ahlfors UG, et al. **Acta Psychiatr Scand** 1981 Sep;64(3):226–37

Serum lithium concentrations around the clock with different treatment regimens and the diurnal variation of the renal lithium clearance. Lauritsen BJ, et al. **Acta Psychiatr Scand** 1981 Oct;64(4):314–9

Lithium kinetics in single daily dosing. Perry PJ, et al. **Acta Psychiatr Scand** 1981 Oct;64(4):281–94

Lithium therapy in China. Brief communication. Shanming Y. **Acta Psychiatr Scand** 1981 Sep;64(3):270–2

Treatment of childhood aggressivity with lithium. Vetro A, et al. **Agressologie** 1981 Nov;22(E):27–30

Human leukocyte interferon–mediated granulopoietic differentiation arrest and its abrogation by lithium carbonate. Verma DS, et al. **Am J Hematol** 1982 Feb;12(1):39–46

Studies of the urinary acidification defect induced by lithium. Bank N, et al. **Am J Physiol** 1982 Jan;242(1):F23–9

Lithium and amino acids [letter] Goodnick PJ, et al. **Am J Psychiatry** 1982 Apr;139(4):538–9

Lithium and glycine levels [letter] Prakash R. **Am J Psychiatry** 1982 Jan; 139(1):132

Questions about combined lithium and haloperidol treatment [letter] Rudorfer MV, et al. **Am J Psychiatry** 1982 Apr;139(4):537–8

Lithium and neuromuscular transmission. Waud BE, et al. **Anesth Analg (Cleve)** 1982 May;61(5):399–402

Blockade of 5–hydroxytryptamine–induced responses of rat seminal vesicle by lithium–possible meciation through calcium exchange.. Gandhi DN, et al. **Arch Int Pharmacodyn Ther** 1981 Oct; 253(2):220–32

Lithium dosage regimen design by the repeated one–point method. Ritschel WA, et al. **Arzneimittelforsch** 1982;32(2):98–102

A study of Li+–selective permeation through lipid bilayer membranes mediated by a new ionophore (AS701). Margalit R, et al. **Biochim Biophys Acta** 1981 Dec 7;649(2):441–8

A new method for the use of salivary lithium concentrations as an indicator of plasma lithium levels. Selinger D, et al. **Biol Psychiatry** 1982 Jan;17(1):99–102

The biological disposition and kinetics of lithium. Thornhill DP. **Biopharm Drug Dispos** 1981 Oct–Dec;2(4):305–22 (121 ref.)

Oscillation of the electrical potential of the frog skin under the effect of Li+: theoretical formulation. Lassalles JP, et al. **Biophys Chem** 1981 Sep;14(1):65–80

Cyclic hematopoiesis: effects of lithium on colony–forming cells and colony–stimulating activity in grey collie dogs. Hammond WP, et al. **Blood** 1982 Jan;59(1):179–84

Aplastic anaemia treated with lithium carbonate [letter] Ricevuti G, et al. **Br J Haematol** 1982 Jan;50(1):173–4

Lithium continuation therapy following electroconvulsive therapy. Coppen A, et al. **Br J Psychiatry** 1981 Oct;139:284–7

Lithium withdrawal triggers psychotic states [letter] Klein HE, et al. **Br J Psychiatry** 1981 Sep;139:255–6

Dietary sodium, erythrocyte sodium concentration, sodium–stimulated lithium efflux and blood pressure. Trevisan M, et al. **Clin Sci [Suppl]** 1981 Dec;61(7):29s–32s

Cerebral fluoride in mania and the effect of lithium: a hypothesis. Gal EM. **Commun Psychopharmacol** 1980;4(5):405–9

Mechanism of lithium–induced elevation in red blood cell choline content: an in vitro analysis. Hanin I, et al. **Commun Psychopharmacol** 1980; 4(5):345–55

A mechanism for the accumulation of choline in erythrocytes during treatment with lithium. Jenden DJ, et al. **Commun Psychopharmacol** 1980;4(5):339–44

Renal toxicity of lithium. Hansen HE. **Drugs** 1981 Dec;22(6):461–76 (96 ref.)

Lithium nephrotoxicity: is there cause for concern? Walker RG, et al. **Drugs** 1981 Dec;22(6):421–2

Distribution of lithium elimination rates in a selected population of psychiatric patients. Thornhill DP, et al. **Eur J Clin Pharmacol** 1982; 21(4):351–4

The effect of lithium on rat brain and erythrocyte glycine levels. Deutsch SI, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):75–6

Lithium dissociates haloperidol–induced behavioral supersensitivity from reduced dopac increase in rat striatum. Meller E, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):25–9

Does protein synthesis decline in lithium–treated sea urchin embryos because RNA synthesis is inhibited? Wolcott DL. **Exp Cell Res** 1982 Feb;137(2):427–31

Influence of lithium on proliferation of hematopoietic stem cells. Gallicchio VS, et al. **Exp Hematol** 1981 Aug;9(7):804–10

Comparison of colony stimulating activities secreted into mouse lung conditioned medium in the presence and absence of lithium chloride. Horak H, et al. **Exp Hematol** 1982 Jan;10(1):123–9

Reversal of in vitro drug induced myeloid suppression by lithium. Miller AM, et al. **Exp Hematol** 1981 Aug;9(7):775–80

Effect of Na+, K+ and Li+ on pH dependence of in situ beta–galactosidase from E. coli. de Arriaga D, et al. **Int J Biochem** 1982;14(1):47–52

Effects of lithium on rat tail nerve conduction velocity. Ebara T, et al. **Int Pharmacopsychiatry** 1981;16(3):129–37

Poor prophylactic lithium response due to antidepressants. Reginaldi D, et al. **Int Pharmacopsychiatry** 1981;16(2):124–8

Adverse effects of lithium therapy in the acutely ill elderly patient. Smith RE, et al. **J Clin Psychiatry** 1981 Mar;43(3):94–9

Bioavailability of lithium carbonate: single versus multiple daily dosing. Bone S, et al. **J Clin Psychopharmacol** 1981 Nov;1(6):390–1

A double–blind controlled trial of lithium carbonate primary anorexia nervosa. Gross HA, et al. **J Clin Psychopharmacol** 1981 Nov; 1(6):376–81

A clarification of 'some hazards of lithium use' [letter] Jefferson JW. **J Clin Psychopharmacol** 1981 Nov;1(6):409

Slowed release lithium: a review and a comparative study. Lyskowski J, et al. **J Clin Psychopharmacol** 1981 Nov;1(6):406–8

Early changes in renal distal convoluted tubules and collecting ducts of lithium–treated rats: light microscopy, enzyme histochemistry, and 3H–thymidine autoradiography. Jacobsen NO, et al. **Lab Invest** 1982 Mar;46(3):298–305

Albumin and beta 2–microglobulin excretion in patients on long–term lithium treatment. Hansen HE, et al. **Nephron** 1981;29(5–6):229–32

Effect of lithium on circadian neurotransmitter receptor rhythms. Kafka MS, et al. **Neuropsychobiology** 1982 Jan–Feb;8(1):41–50

Lithium delays biochemical circadian rhythms in rats. McEachron DL, et al. **Neuropsychobiology** 1982 Jan–Feb;8(1):12–29

Lack of benefit from magnesium in lithium toxicity. Zohar J, et al. **Neuropsychobiology** 1982 Jan–Feb;8(1):10–1

Beta–adrenergic receptors in rat cerebellum after neonatal X–irradiation: effect of prolonged imipramine and lithium treatment. Türck M, et al. **Neurosci Lett** 1981 Dec 23;27(3):357–62

Biological factors in affective disorders and their relevance to lithium prophylaxis. Mendlewicz J. **Pharmacopsychiatria** 1982 Jan;15(1):11–8

Effects of lithium administration on central and peripheral nervous system in rats. Biochemical and morphological findings. Scelsi R, et al. **Pharmacopsychiatria** 1981 Nov;14(6):213–6

Lithium–induced polydipsia in birds: a comparative study and analysis of electrolyte excretion. Hardy WT, et al. **Physiol Behav** 1981 Oct; 27(4):575–83

Period lengthening and disruption of socially facilitated circadian activity rhythms of goldfish by lithium. Kavaliers M. **Physiol Behav** 1981 Oct; 27(4):625–8

Establishing lithium clinics in office practice. Hasan MK, et al. **Postgrad Med** 1982 Feb;71(2):182, 186, 190

Lithium's effects on the kidney. Lippmann S. **Postgrad Med** 1982 Mar; 71(3):99–104, 107–8

Lithium stimulates thromboxane B2 formation in human platelets. Imandt L, et al. **Prostaglandins Med** 1981 Nov;7(5):421–9

Course and relationship of lithium side effects to plasma lithium levels. Peselow ED, et al. **Psychiatr Clin (Basel)** 1981;14(3):178–83

The effects of desmethylimipramine and lithium on human sperm function. Amsterdam JD, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):359–63

Mood, creativity, and psychotherapeutic participation of patients receiving lithium. Phillips RH. **Psychosomatics** 1982 Jan;23(1):81–7

Effect of lithium chloride on the circadian rhythm in the flight activity of the microchiropteran bat, Taphozous melanopogon. Subbaraj R. **Z Naturforsch [C]** 1981 Nov–Dec;36(11–12):1068–71

[Effect of diuretics on the distribution and renal excretion of lithium in rats of different ages] Kersten L, et al. **Acta Biol Med Ger** 1981; 40(6):837–48 (Eng. Abstr.) **(Ger)**

[Recurrence prophylaxis of affective diseases with lithium and their results] Felber W. **Psychiatr Clin (Basel)** 1981;14(3):161–6 (Eng. Abstr.) **(Ger)**

[Lithium in the prophylaxis of recurrent affective disorders. Effectiveness of low plasma levels and predictors to clinical response (author's transl)] Faravelli C, et al. **Riv Patol Nerv Ment** 1980 Nov–Dec; 101(6):261–71 (Eng. Abstr.) **(Ita)**

[Effect of chronic administration of lithium chloride on the development of dopamine receptor sensitivity during morphine withdrawal in rats] Allikmets LKh, et al. **Biull Eksp Biol Med** 1981 Nov;92(11):571–2 (Eng. Abstr.) **(Rus)**

[Effect of lithium on the renal excretory function and Na, K–ATPase activity in rats] Vasil'eva VF, et al. **Fiziol Zh SSSR** 1981 Dec; 67(12):1866–72 (Eng. Abstr.) **(Rus)**

[Effect of the structural integrity of Na,K–ATPase preparations on the ability of lithium to substitute for sodium in enzyme activation] Skul'skil IA, et al. **Tsitologiia** 1982 Jan;24(1):95–8 (Eng. Abstr.) **(Rus)**

MEMORY

Pharmacological modulation of memory: trends and problems. Mondadori C. **Acta Neurol Scand [Suppl]** 1981;89:129–43

The effects of nutritional factors on memory. Wurtman RJ. **Acta Neurol Scand [Suppl]** 1981;89:145–54

Time–dependent environmentally–induced changes in cerebral and extra–cerebral morphology and chemistry—the basis of learning, memory and behavior. DeFeudis FV. **Gen Pharmacol** 1982;13(1):1-9 (97 ref.)

Correlation between retention of defensive conditioned reflexes and brain acetylcholinesterase activity in rats. Dish TN. **Neurosci Behav Physiol** 1981 May-Jun;11(3):230-3

Effect of an amnesic dose of reserpine, syrosingopine or guanethidine on the levels of whole brain dopamine and norepinephrine in the mouse. Brown OM, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):911-4

The role of dopaminergic mechanisms in the rat hippocampus for the consolidation in a brightness discrimination. Grecksch G, et al. **Psychopharmacology (Berlin)** 1981;75(2):165-8

MEMORY, SHORT-TERM

Effects of chemicals on delayed matching behavior in pigeons I: acute effects of drugs. McMillan DE. **Neurotoxicology (Park Forest II)** 1981 Nov;2(3):485-98

MENTAL DISORDERS

Comparison of the dosage schedules during the administration of retarded lithium carbonate. Balon R, et al. **Act Nerv Super (Praha)** 1981; 23(4):278-80

Patterns of psychotropic drug prescriptions in two psychiatric hospitals and two out-patient clinics. Hošek K, et al. **Act Nerv Super (Praha)** 1981;23(4):261-3

Lithium therapy in China. Brief communication. Shanming Y. **Acta Psychiatr Scand** 1981 Sep;64(3):270-2

Problems of psychiatric practice in community mental health centers. Donovan CM. **Am J Psychiatry** 1982 Apr;139(4):456-60

The Boston State Hospital case: a conflict of civil liberties and true liberalism. Schultz S. **Am J Psychiatry** 1982 Feb;139(2):183-8

Hypnotizability and psychopathology. Spiegel D, et al. **Am J Psychiatry** 1982 Apr;139(4):431-7

A program for late twentieth-century psychiatry. Unger RM. **Am J Psychiatry** 1982 Feb;139(2):155-64

Realism and drug refusal: a reply to Appelbaum and Gutheil. Dix GE. **Bull Am Acad Psychiatry Law** 1981;9(3):180-98

Polypsychopharmacy revisited. Rapp MS, et al. **Can J Psychiatry** 1981 Dec;26(8):569-73

The psychodynamics of drug therapy. Thompson EM, et al. **Curr Psychiatr Ther** 1981;20:239-51

Hydergine in senile mental impairment. Loew DM, et al. **Gerontology** 1982 Jan-Feb;28(1):54-74 (76 ref.)

Basic principles of psychotropic drug prescription for the elderly. Salzman C. **Hosp Community Psychiatry** 1982 Feb;33(2):133-6

Models of rationality and mental health rights. Milner N. **Int J Law Psychiatry** 1981;4(1-2):35-52

A cross-national comparison of patterns of utilization and psychiatric care. Erinosho OA, et al. **Int J Soc Psychiatry** 1981 Winter;27(4):289-96

Medication compliance among discharged psychiatric patients. Witt R. **Issues Ment Health Nurs** 1981 Oct-Dec;3(4):305-17

Fourth psychoactive drug usage guide. Appleton WS. **J Clin Psychiatry** 1982 Jan;43(1):12-27

Diagnostic profile of a family practice clinic: patients with psychosocial diagnoses. Stumbo D, et al. **J Fam Pract** 1982 Feb;14(2):281-5

How capable of driving are hospitalized psychiatric patients under psycho-active drug therapy? Hobi V, et al. **J Int Med Res** 1981; 9(6):434-47

Endorphin-mental illness link far from proved [news] Check WA. **JAMA** 1982 Feb 5;247(5):570-1, 575-7

The role of endorphins in neuropsychiatry. **Mod Probl Pharmacopsychiatry** 1981;17:1-290

WHO-coordinated collaborative studies in the effects of psychopharmacological drugs in different populations. Sartorius N. **Mod Probl Pharmacopsychiatry** 1981;16:83-93

Guidelines for the evaluation of drugs in the elderly neuropsychiatric patient (demented and non-demented). **Pharmacopsychiatria** 1981 Nov; 14(6):217-22

Gradients of monoamine metabolites and cortisol in cerebrospinal fluid of psychiatric patients and healthy controls. Bertilsson L, et al. **Psychiatry Res** 1982 Feb;6(1):77-83

Platelet monoamine oxidase activity and behavioral response to pharmacotherapy in psychiatric patients. Rosen AJ, et al. **Psychiatry Res** 1982 Feb;6(1):49-59

Comparison of biochemical properties of platelet monoamine oxidase in mentally disordered and healthy individuals. Yu PH, et al. **Psychiatry Res** 1982 Feb;6(1):107-21

Long-term psychotropic drug-taking and the process of withdrawal. Murray J. **Psychol Med** 1981 Nov;11(4):853-8

[The ego functions. A psychoanalytical objective in psychopharmacological research? (author's transl)] D'Haenen H. **Acta Psychiatr Belg** 1981 Sep-Oct;81(5):452-9 (Eng. Abstr.) (Fre)

[Psychoanalysis or pharmacologic blockage in cultivation of mentally handicapped] Baruk H. **Ann Med Psychol (Paris)** 1981;139(3):335-8 (Fre)

[Open study of minaprine in a child psychiatry population (author's transl)] de Villard R, et al. **Neuropsychiatr Enfance Adolesc** 1981 Apr-May; 29(4-5):255-8 (Eng. Abstr.) (Fre)

[Concerning the interpretation of the contingent negative variation in psychiatry (author's transl)] Timsit-Berthier M. **Rev Electroencephalogr Neurophysiol Clin** 1981 Nov;11(2):236-44 (Eng. Abstr.) (Fre)

[Semiology and clinical findings in psychiatric emergencies] Poncelet PF. **Rev Med Liege** 1981 Dec 1;36(23):850-5 (Fre)

[Misunderstanding between neuroscientists and clinicians (author's transl)] Bleuler M. **Nervenarzt** 1982 Jan;53(1):14-7 (Ger)

[The boundary between psychiatry and biological therapeutics] Carrillo Broatch A. **Rev Neuropsiquiatr** 1980 Jun;43(2):87-96 (Eng. Abstr.) (Spa)

MENTAL HEALTH

[Some relations of mental hygiene and psychopharmacology (author's transl)] Molčan J, et al. **Cesk Psychiatr** 1981 Jun;77(3):173-5 (Eng. Abstr.) (Slo)

MENTAL PROCESSES

Vasopressins and other neuropeptides as CNS mental modulators. A review. Edelstein EL. **Isr J Psychiatr Relat Sci** 1981;18(3):229-36

METHOTRIMEPRAZINE

Neuroleptics in neurotic anxiety. Boleloucky Z. **Agressologie** 1981 Nov; 22(D):15-7

Simultaneous determination of chlorpromazine and levomepromazine in human plasma and urine by high-performance liquid chromatography using electrochemical detection. Murakami K, et al. **J Chromatogr** 1982 Jan 8;227(1):103-12

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskiĭ Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) (Rus)

METHYLPHENIDATE

Postoperative effects of methylphenidate [letter] Fassoulaki A. **Br J Anaesth** 1981 Dec;53(12):1365-6

The use of psychopharmacology to study reciprocal influences in parent-child interaction. Barkley RA. **J Abnorm Child Psychol** 1981 Sep;9(3):303-10

A four-year follow-up study of the effects of methylphenidate on the behavior and academic achievement of hyperactive children. Charles L, et al. **J Abnorm Child Psychol** 1981 Dec;9(4):495-505

Synthesis and pharmacology of hydroxylated metabolites of methylphenidate. Patrick KS, et al. **J Med Chem** 1981 Oct; 24(10):1237-40

Methylphenidate compared with behavioral self-control in attention deficit disorder: preliminary report. Anderson EE, et al. **JDBP** 1981 Dec;2(4):137-41

The methylphenidate-induced stereotypy in the awake rat: local cerebral metabolism. Bell RD, et al. **Neurology (NY)** 1982 Apr;32(4):377-81

Growth hormone and prolactin secretion in adults and hyperactive children: relation to methylphenidate serum levels. Gualtieri CT, et al. **Psychoneuroendocrinology** 1981 Dec;6(4):331-9

METHYSERGIDE

Antagonism by methysergide of the effects of L-5-hydroxytryptophan and quipazine on schedule-controlled responding. Leander JD. **Neuropharmacology** 1981 Dec;20(12A):1141-3

MOTIVATION

Age-related decline in brain stimulation reward: rejuvenation by amphetamine. Lewis MJ. **Exp Aging Res** 1981 Fall;7(3):225-34

Differential drug effects as a function of the controlling consequences. Barrett JE. **Natl Inst Drug Abuse Res Monogr Ser** 1981 Jul; (37):159-81 (40 ref.)

MOTOR ACTIVITY

Exploitation of the antagonistic properties of some drugs against poisoning with psychochemicals. Koupilová M, et al. **Act Nerv Super (Praha)** 1981; 23(4):292-3

The effects of imipramine on socio-emotional and alimentary motivated behavior in dogs. Zagrodzka J, et al. **Acta Neurobiol Exp (Warsz)** 1981; 41(4):363–72

Functional importance of nucleus accumbens noradrenaline in the rat. Svensson L, et al. **Acta Pharmacol Toxicol (Copenh)** 1982 Jan; 50(1):22–4

Central neurotropic activity of homovanillic acid. Kleinrok Z, et al. **Acta Physiol Pol** 1981 Sep–Oct;32(5):477–85

Role of GABA neurons in the expression of striatal motor functions. Di Chiara G, et al. **Adv Biochem Psychopharmacol** 1981;30:129–63 (77 ref.)

Evidence for the involvement of nigrothalamic GABA neurons in circling behaviour in the rat. Kilpatrick IC, et al. **Adv Biochem Psychopharmacol** 1981;30:205–24

Critical role of midbrain reticular formation in the expression of dopamine–mediated circling behaviour. Reavill C, et al. **Adv Biochem Psychopharmacol** 1981;30:187–204

The GABAergic systems and the role of basal ganglia in motor control. Yoshida M. **Adv Biochem Psychopharmacol** 1981;30:37–52

Behavioral and neurochemical changes in rats simultaneously exposed to manganese and lead. Chandra AV, et al. **Arch Toxicol** 1981 NOV; 49(1):49–56

The involvement of the catecholaminergic system in physostigmine–induced hyperactivity in rats. Egbe PC. **Arzneimittelforsch** 1982;32(1):27–9

Neurochemical and behavioural correlates of the interaction between amphetamine and delta 9–tetrahydrocannabinol in the rat. LewdEO, et al. **Drug Alcohol Depend** 1981 Sep;8(2):93–101

Behavioural evidence for supersensitivity of postsynaptic dopamine receptors in the mesolimbic system after chronic administration of desipramine. Spyraki C, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2–3):195–206

p-Chloroamphetamine: effects on tonic immobility, activity, and temperature in chickens. Boren JL, et al. **J Comp Physiol Psychol** 1981 Dec;95(6):991–1002

Enhanced responsiveness of alpha–noradrenergic receptors following discrete electrolytic lesions of the nucleus locus coeruleus: a behavioral demonstration. De Carvalho LP, et al. **J Neural Transm** 1982; 53(1):23–37

Enhancement of motor–accelerating effect induced by repeated administration of methamphetamine in mice: involvement of environmental factors. Alam MR. **Jpn J Pharmacol** 1981 Dec; 31(6):897–904

Effect of low–dose nitrazepam on performance in the elderly [letter] Morgan K. **Lancet** 1982 Feb 27;1(8270):516

Motor effects following application of putative excitatory amino acid antagonists to the region of the mesencephalic dopamine cell bodies in the rat. Dawbarn D, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(2):100–4

Behavioural and neurochemical studies on apomorphine–induced hypomotility in mice. Sumners C, et al. **Neuropharmacology** 1981 Dec; 20(12A):1203–8

Persistent alteration of rat brain monoamine levels by carbon monoxide exposure: sex differences and behavioral correlation. Shellenberger MK. **Neurotoxicology (Park Forest Il)** 1981 Nov;2(3):431–41

Possible mechanism of 5–methoxy–N,N–dimethyltryptamine–induced turning behaviour in DRN lesioned rats. Blackburn TP, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):7–11

Infant rat hyperactivity elicited by home cage bedding is unaffected by neonatal telencephalic dopamine or norepinephrine depletion. Pappas BA, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):151–4

The effects of quipazine, fenfluramine and apomorphine on the morphine potentiation of tonic immobility. Wallnau LB. **Pharmacol Biochem Behav** 1981 Dec;15(6):895–901

Period lengthening and disruption of socially facilitated circadian activity rhythms of goldfish by lithium. Kavaliers M. **Physiol Behav** 1981 Oct; 27(4):625–8

Effects of cholinomimetics, cholinolytics and atypical antidepressants in the behavioral despair test in the rat. Herman ZS, et al. **Pol J Pharmacol Pharm** 1981;33(5):485–9

Differential effects of l–amphetamine on ontogeny of active avoidance, intertrial responses, and locomotor activity. Bauer R, et al. **Psychopharmacology (Berlin)** 1981;75(3):299–304

Collicular picrotoxin alleviates akinesia but not sensory neglect in rats with bilateral 6–hydroxydopamine lesions of ventral midbrain. Redgrave P, et al. **Psychopharmacology (Berlin)** 1981;75(2):204–9

[Effects of the destruction of the suprachiasmatic nuclei on the circadian rhythms of ACTH corticosterone and the general activity of female rats exposed to a aperiodic environment] Szafarczyk A, et al. **C R Soc Biol (Paris)** 1981;175(6):801–10 (Eng. Abstr.) **(Fre)**

[Effect of GABA on motor activity in the rat during the early postnatal period] Malakhovskaia DB, et al. **Zh Vyssh Nerv Deiat** 1982 Jan–Feb; 32(1):115–21 (Eng. Abstr.) **(Rus)**

[Automatic quantitative evaluation of spontaneous motor activity. Validation of the method] Tintoré I. **Arch Farmacol Toxicol** 1981 Apr; 7(1):79–82 **(Spa)**

MOTOR SKILLS

Hypnotic activity and effects on performance of lormetazepam and camazepam––analogues of temazepam. Nicholson AN, et al. **Br J Clin Pharmacol** 1982 Mar;13(3):433–9

Fine motor performance before and after treatment in schizophrenic and schizoaffective patients. Goode DJ, et al. **Psychiatry Res** 1981 Dec; 5(3):247–55

MSH

Immunoreactive gamma–melanotropin in rat pituitary and plasma: a partial characterization. Pedersen RC, et al. **Endocrinology** 1982 Mar; 110(3):825–34

Biosynthesis of pairs of peptides related to melanotropin, corticotropin and endorphin in the pars intermedia of the amphibian pituitary gland. Martens GJ, et al. **Eur J Biochem** 1982 Feb;122(1):1–10

In vitro study of frog (Rana ridibunda Pallas) neurointermediate lobe secretion by use of a simplified perifusion system. I. Effect of TRH analogs upon alpha–MSH release. Leroux P, et al. **Gen Comp Endocrinol** 1982 Jan;46(1):13–23

Presence of immunoreactive gamma–melanocyte–stimulating hormone, adrenocorticotropin, and beta–endorphin in human gastric antral mucosa. Tanaka I, et al. **J Clin Endocrinol Metab** 1982 Feb; 54(2):392–6

Beta–adrenergic stimulation induces an increase of the plasma levels of immunoreactive alpha–MSH, beta–endorphin, ACTH and of corticosterone. Berkenbosch F, et al. **Life Sci** 1981 Nov 30; 29(22):2249–56

Direct in vitro stimulation of pituitary LH release by alpha melanocyte stimulating hormone. Miyake A, et al. **Life Sci** 1981 Dec 21; 29(25):2637–40

NEUROREGULATORS

Biochemical consequences of kainic acid injection into the lateral brain ventricle in rat. Kleinrok Z, et al. **Acta Biochim Pol** 1981; 28(2):111–22

Neurotransmitter metabolizing enzymes and plasma butyrylcholinesterase in mice exposed to trichloroethylene. Kanje M, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):205–9

Transmitterlike action of serotonin in phase shifting a rhythm from the Aplysia eye. Corrent G, et al. **Am J Physiol** 1982 Mar; 242(3):R333–8

Release of transmitter at the neuromuscular junction. Standaert FG. **Br J Anaesth** 1982 Feb;54(2):131–45 (82 ref.)

Vacuolation of an identified peptidergic (proctolin-containing) neuron. Adams ME, et al. **Brain Res** 1981 Dec 28;230(1–2):439–44

Lateral asymmetry of neurotransmitters in human brain. Glick SD, et al. **Brain Res** 1982 Feb 18;234(1):53–63

Inner plexiform circuits in the carp retina: effects of cholinergic agonists, GABA, and substance P on the ganglion cells. Glickman RD, et al. **Brain Res** 1982 Feb 18;234(1):81–99

Kainic acid neurotoxicity; effect of systemic injection on neurotransmitter markers in different brain regions. Heggli DE, et al. **Brain Res** 1981 Dec 28;230(1–2):253–62

Effects of neurotransmitters and cyclic AMP on somatostatin release from cultured cerebral cortical cells. Robbins RJ, et al. **Brain Res** 1982 Feb 25;234(2):377–86

Transmitter sensitivities among various types of cultured brain stem neurons. Saji M, et al. **Brain Res** 1982 Feb 4;233(1):83–96

Regulation of thyrotropin–releasing hormone secretion from frog skin. Bolaffi JL, et al. **Endocrinology** 1982 Mar;110(3):842–6

Sex hormones and neurotransmitters as mediators for sexual differentiation of the brain. Dörner G. **Endokrinologie** 1981 Dec;78(2–3):129–38 (31 ref.)

Schistosoma mansoni: neurotransmitters, longitudinal musculature and effects of electrical stimulation. Pax RA, et al. **Exp Parasitol** 1981 Dec; 52(3):346–55

Vasopressins and other neuropeptides as CNS mental modulators. A review. Edelstein EL. **Isr J Psychiatr Relat Sci** 1981;18(3):229–36

Neurotransmitter effects on release of prolactin and growth hormone in vitro from pituitary glands of the pigeon, Columba livia. Hall TR. **J Endocrinol** 1982 Feb;92(2):303–8

Relation between subsynaptic receptor blockade and response to quantal transmitter at the mouse neuromuscular junction. Pennefather P, et al. **J Gen Physiol** 1981 Sep;78(3):313–44

Amine modulation of the neurogenic Limulus heart. Augustine GJ, et al. **J Neurobiol** 1982 Jan;13(1):61–74

Histamine: correlative studies in nucleus accumbens. Chronister RB, et al. **J Neurobiol** 1982 Jan;13(1):23–37

Physiology and in situ identification of putative aminergic neurotransmitters in the nervous system of Gyrocotyle fimbriata, a parasitic flatworm. Keenan L, et al. **J Neurobiol** 1982 Jan;13(1):9–21

Transmitter release in crayfish neuromuscular junction: comments on the article by Staggs et al. (1980). Parnas I, et al. **J Neurobiol** 1982 Jan; 13(1):75–7

Effect of motor and premotor cortex ablation on concentrations of amino acids, monoamines, and acetylcholine and on the ultrastructure in rat striatum. A confirmation of glutamate as the specific cortico-striatal transmitter. Hassler R, et al. **J Neurochem** 1982 Apr;38(4):1087-98

Identification of synapse specific components: synaptic glycoproteins, proteins, and transmitter binding sites. Mena EE, et al. **J Neurochem** 1981 Dec;37(6):1557-66

Functional activity of substantia nigra grafts reinnervating the striatum: neurotransmitter metabolism and [14C]2-deoxy-D-glucose autoradiography. Schmidt RH, et al. **J Neurochem** 1982 Mar; 38(3):737-48

The aluminum-formaldehyde (ALFA) histofluorescence method for improved visualization of catecholamines and indoleamines. 2. Model experiments. Björklund A, et al. **J Neurosci Methods** 1980 Jun; 2(3):301-18

The aluminum-formaldehyde (ALFA) histofluorescence method for improved visualization of catecholamines and indoleamines. I. A detailed account of the methodology for central nervous tissue using paraffin, cryostat or Vibratome sections. Lorén I, et al. **J Neurosci Methods** 1980 Jun;2(3):277-300

Induced neurotransmitter release from primary cultures of rat brain neurons. Zurgil N, et al. **Life Sci** 1981 Nov 30;29(22):2265-71

Membrane potential and conductance changes evoked by hormones and neurotransmitters in mammalian exocrine gland cells. Petersen OH, et al. **Methods Cell Biol** 1981;23:513-30 (56 ref.)

FMRFamide neuropeptides simultaneously increase and decrease K+ current in an identified neurone. Cottrell GA. **Nature** 1982 Mar; 296(5852):87-9

Inhibition of spontaneous transmitter release by the membrane ligand cationized ferritin. Publicover SJ. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):246-8

Role of cholinergic and monoaminergic brain systems in dissociated learning. Arkhipov VI, et al. **Neurosci Behav Physiol** 1981 May-Jun; 11(3):226-9

Neurotransmitter modulation of steroid action in target cells that mediate reproduction and reproductive behavior. Nock B, et al. **Neurosci Biobehav Rev** 1981 Winter;5(4):437-47

Stability of CNS bindings sites under various conditions. Uphouse L, et al. **Neurotoxicology (Park Forest Il)** 1981 Nov;2(3):533-40

Electrophysiologic evidence for involvement of acetylcholine as a neurotransmitter in the lateral vestibular nucleus. Ito J, et al. **Otolaryngol Head Neck Surg** 1981 Nov-Dec;89(6):1025-9

Nontraditional neurotransmitters and prolactin release. Donoso AO, et al. **Prog Clin Biol Res** 1981;74:219-28 (35 ref.)

The psychobiology of depressive disorders: from pathophysiology to predisposition. Depue RA, et al. **Prog Exp Pers Res** 1981;10:1-114 (436 ref.)

Aspartate: possible neurotransmitter in cerebellar climbing fibers. Wiklund L, et al. **Science** 1982 Apr 2;216(4541):78-80

Release of some neurotransmitters from the retina. Bauer B, et al. **Vision Res** 1981;21(11):1665-72

Evidence for a serotonin neurotransmitter system in bovine retina. Redburn DA, et al. **Vision Res** 1981;21(11):1673-6

NEUROTENSIN

Neurotensin effects on brain dopaminergic systems. Haubrich DR, et al. **Brain Res** 1982 Jan 7;231(1):216-21

Effect of dorsal rhizotomy on the autoradiographic distribution of opiate and neurotensin receptors and neurotensin-like immunoreactivity within the rat spinal cord. Ninkovic M, et al. **Brain Res** 1981 Dec 28; 230(1-2):111-9

Distribution of neuropeptides in the dorsal pontine tegmental area of the rat. Matsuzaki T, et al. **Cell Mol Biol** 1981;27(5):499-508

Immunoreactive calcitonin in maternal milk and serum in relation to prolactin and neurotensin. Werner S, et al. **Early Hum Dev** 1982 Jan; 6(1):77-82

Amphibian neurotensin (NT) is not xenopsin (XP): dual presence of NT-like and XP-like peptides in various amphibia. Carraway R, et al. **Endocrinology** 1982 Apr;110(4):1094-101

Histamine release induced by neurotensin from rat peritoneal mast cells. Kurose M, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):129-36

Abnormalities of the colonic regulatory peptides in Hirschsprung's disease. Bishop AE, et al. **Histopathology** 1981 Nov;5(6):679-88

The regional distribution and chromatographic characterisation of neurotensin-like immunoreactivity in the rat central nervous system. Emson PC, et al. **J Neurochem** 1982 Apr;38(4):992-9

Neurohumoral control of ileal electrolyte transport. II. Neurotensin and substance P. Kachur JF, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):456-63

Pancreatic endocrine responses to physiological changes in plasma neurotensin concentration in the calf. Blackburn AM, et al. **J Physiol (Lond)** 1981 Sep;318:407-12

Effect of neurotensin on pancreatic function in man. Fletcher DR, et al. **Life Sci** 1981 Nov 23;29(21):2157-61

Neurotensin-induced release of endogenous noradrenaline from rat hypothalamic slices. Okuma Y, et al. **Life Sci** 1982 Jan 4; 30(1):77-84

An hypothesis of the molecular structure of the dopamine receptor. Smythies JR. **Med Hypotheses** 1981 Dec;7(12):1449-56

A survey of substance P, somatostatin, and neurotensin levels in aging in the rat and human central nervous system. Buck SH, et al. **Neurobiol Aging** 1981 Winter;2(4):257-64

Peptidergic innervation of the mammalian sinus nodes: vasoactive intestinal polypeptide, neurotensin, substance P. Weihe E, et al. **Neurosci Lett** 1981 Nov 4;26(3):283-8

Neurotensin inhibits LH release. Motta M, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):62-4

[Neuropeptides in the rabbit eye. I. RIA for beta-endorphin, substance P and neurotensin in the aqueous humor, iris-ciliary body and retina (author's transl)] Baba S, et al. **Nippon Ganka Gakkai Zasshi** 1981 Sep 10;85(9):1267-72 (Eng. Abstr.) **(Jpn)**

NEUROTIC DISORDERS

Anxiety and placebo reaction in neurotic patients. Plevova J, et al. **Agressologie** 1981 Oct;22(C):47-9

Anxiety and placebo reaction in neurotic patients. Plevova J, et al. **Agressologie** 1981 Nov;22(E):31-2

Clinical investigations of some anxiolytics drugs. Welbel SL. **Agressologie** 1981 Oct;22(C):39-40

Assessment of pharmacodynamics of a new 'controlled release' form of diazepam (Valium CR Roche) by quantitative EEG and psychometric analysis in neurotic subjects. Saletu B, et al. **J Int Med Res** 1981; 9(6):408-33

[Psychopharmacology and Research into Borderline states (author's transl)] Boleloucký Z, et al. **Cesk Psychiatr** 1981 Jun;77(3):148-52 (Eng. Abstr.) **(Cze)**

[Personality, antidepressant and neuroses] Boleloucký Z, et al. **Agressologie** 1981 Nov;22(E):3-5 **(Fre)**

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskiĭ Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) **(Rus)**

[Clinicobiochemical parallels in borderline neuropsychic disorders] Ushakov GK, et al. **Zh Nevropatol Psikhiatr** 1981;81(11):1663-6 (Eng. Abstr.) **(Rus)**

[Effects of piracetam in healthy dogs and dogs with experimental neuroses] Aĭrapetiants MG, et al. **Zh Vyssh Nerv Deiat** 1981 Nov-Dec; 31(6):1164-70 (Eng. Abstr.) **(Rus)**

NITRAZEPAM

Consumption of diazepam, nitrazepam and barbiturates in 5 large hospitals in Prague by defined daily doses per bed/day. Ivančová J, et al. **Act Nerv Super (Praha)** 1981;23(4):267-9

Influence of sex, menstrual cycle and oral contraception on the disposition of nitrazepam. Jochemsen R, et al. **Br J Clin Pharmacol** 1982 Mar; 13(3):319-24

Effect of low-dose nitrazepam on performance in the elderly [letter] Morgan K. **Lancet** 1982 Feb 27;1(8270):516

Differential inhibition by diazepam and nitrazepam of UDP-glucuronyltransferase activities in rats. del Villar E, et al. **Res Commun Chem Pathol Pharmacol** 1981 Sep;33(3):433-47

NOREPINEPHRINE

LCEC analysis of 5-hydroxytryptamine and norepinephrine in the human gastrointestinal tract. Smeds S, et al. **Acta Chir Scand** 1981; 147(5):361-2

Effect of 2-substituted oestrogens in vivo on the metabolism of noradrenaline in rat brain. Kö[illegible]er G, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):1-8

Investigations on possible presynaptic effect of adenosine and noradrenaline on cholinergic neurotransmission in guinea pig trachea. Grundström N, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Aug;

49(2):158–60

Functional importance of nucleus accumbens noradrenaline in the rat. Svensson L, et al. **Acta Pharmacol Toxicol (Copenh)** 1982 Jan; 50(1):22–4

Role of some biogenic amines in the pathomechanism of glomerulonephritis. II. Adrenaline, noradrenaline and serotonin in acute serum sickness in rabbits. Gębala A, et al. **Acta Physiol Pol** 1981; 32(4):363–73

Role of some biogenic amines in the pathomechanism of glomerulonephritis. Zajączkowska M, et al. **Acta Physiol Pol** 1981; 32(4):375–82

Sodium intake alters the effects of norepinephrine on the renin system and the kidney. Rankin LI, et al. **Am J Kidney Dis** 1981 Nov; 1(3):177–84

Renal handling of dopa, dopamine, norepinephrine, and epinephrine in the dog. Ball SG, et al. **Am J Physiol** 1982 Jan;242(1):F56–62

Free fatty acid mobilization in rats following intracerebroventricular norepinephrine. Barbosa MC, et al. **Am J Physiol** 1982 Apr; 242(4):E248–52

Adaptive changes of pyruvate oxidation in perfused heart during adrenergic stimulation. Bünger R, et al. **Am J Physiol** 1982 Jan; 242(1):H30–6

Rapid fluctuations in plasma catecholamines in monkeys under undisturbed conditions. Hansen BC, et al. **Am J Physiol** 1982 Jan; 242(1):E40–6

Reduced norepinephrine turnover in brown adipose tissue of ob/ob mice. Knehans AW, et al. **Am J Physiol** 1982 Apr;242(4):E253–61

Electrophysiologic correlates of steroid modulation of luteinizing hormone release. Leung PC, et al. **Am J Physiol** 1982 Mar; 242(3):E164–70

Catecholamine sensitivity in brown fat cells from cold-acclimated hamsters and rats. Nedergaard J. **Am J Physiol** 1982 Mar; 242(3):C250–7

Catecholamine release and blood pressure changes induced by exercise in dogfish. Opdyke DF, et al. **Am J Physiol** 1982 Mar; 242(3):R306–10

Regulation of norepinephrine levels in synaptic clefts of dog vascular tissue. Rorie DK, et al. **Am J Physiol** 1982 Feb;242(2):H233–9

Neural and extraneural catecholamine production by rat kidneys. Stephenson RK, et al. **Am J Physiol** 1982 Mar;242(3):F261–6

The role of calcium in the stimulation of gluconeogenesis by catecholamines. Yip BP, et al. **Arch Biochem Biophys** 1981 Dec; 212(2):370–7

Adrenergic receptor sensitivity in depression. Effects of clonidine in depressed patients and healthy subjects. Charney DS, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):290–4

The peripheral kinetics of norepinephrine in depressive illness. Esler M, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):295–300

Impaired presynaptic regulation of norepinephrine in schizophrenia. Effects of clonidine in schizophrenic patients and normal controls. Sternberg DE, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):285–9

Effect of chronic propranolol treatment and withdrawal on norepinephrine and tyrosine hydroxylase in sympathetic tissues. Atkins F, et al. **Arch Int Pharmacodyn Ther** 1981 Dec;254(2):271–81

Formation of 3H–dopamine and 3H–noradrenaline from 3H–tyrosine in the canine saphenous vein. Boels PJ, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):315–16

On the mechanism of noradrenaline–induced prostaglandin E2–Synthesis in primary cell cultures from rabbit splenic pulpa. Brückner–Schmidt R, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):266–77

Effects of renal nerve stimulation, norepinephrine and angiotensin II on renal blood flow in relation to release of PG–like substances in anesthetized dogs. Satoh S, et al. **Arch Int Pharmacodyn Ther** 1981 Dec; 254(2):304–16

Urinary excretion of catecholamines in the night monkey (Aotus trivirgatus) (Primates, Cebidae). Peyrin L, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):345–56

Cyclic AMP response to norepinephrine in the limbic forebrain of male and female rats: effect of desipramine. Mishra R, et al. **Biochem Pharmacol** 1981 Nov 15;30(22):3126–8

Catecholamine binding to the alpha–adrenergic receptors of hamster adipocytes. Evidence that guanine nucleotides regulate this binding to the alpha 2–receptor subtype. Pecquery R, et al. **Biochim Biophys Acta** 1982 Jan 12;714(1):14–25

Regional differences in the density of perivascular nerves and varicosities, noradrenaline content and responses to nerve stimulation in the rabbit ear artery. Griffith SG, et al. **Blood Vessels** 1982 Jan–Feb; 19(1):41–52

Factors influencing the release of purines and norepinephrine in the rabbit portal vein. Levitt B, et al. **Blood Vessels** 1982 Jan–Feb;19(1):30–40

The effect of age on the responses of human isolated arteries to noradrenaline. Scott PJ, et al. **Br J Clin Pharmacol** 1982 Feb; 13(2):237–9

Insulin–induced enhancement of uptake of noradrenaline in atrial strips. Bhagat B, et al. **Br J Pharmacol** 1981 Oct;74(2):325–32

Altered neuronal responsiveness to biogenic amines in rat cerebral cortex after serotonin denervation or depletion. Ferron A, et al. **Brain Res** 1982 Jan 7;231(1):93–108

Behavior during hippocampal microinfusions. I. Norepinephrine and diversive exploration. Flicker C, et al. **Brain Res** 1982 Mar; 257(1):79–103

Amygdalar noradrenergic and dopaminergic mechanisms in the regulation of hunger and thirst–motivated behavior. Lénárd L, et al. **Brain Res** 1982 Feb 4;233(1):115–32

The structure of cerebral cortex in the rat following prenatal administration of 6–hydroxydopamine. Lidov HG, et al. **Brain Res** 1982 Jan;255(1):81–108

The noradrenergic system in cultured aggregates of fetal rat brain cells: morphology of the aggregates and pharmacological indices of noradrenergic neurons. Majocha RE, et al. **Brain Res** 1981 Dec 28; 230(1–2):235–52

Involvement of GABA in the feedback action of estradiol on gonadotropin and prolactin release: hypothalamic GABA and catecholamine turnover rates. Mansky T, et al. **Brain Res** 1982 Jan 14;231(2):353–64

Inhibitory action of the ventral noradrenergic bundle on the lateral hypothalamic neurons through alpha–noradrenergic mechanisms in the rat. Miyahara S, et al. **Brain Res** 1982 Feb 25;234(2):459–63

Release of GABA from the guinea–pig neocortex induced by electrical stimulation of the 'locus coeruleus' or by norepinephrine. Moroni F, et al. **Brain Res** 1982 Jan 28;232(1):216–21

The role of the noradrenergic system on the formation of synapses in the visual cortex of the rat. Parnavelas JG, et al. **Brain Res** 1982 Jan; 255(1):140–4

Effect of des–Tyr1–gamma–endorphin and des–Tyr1–alpha–endorphin on alpha–MPT–induced catecholamine disappearance in rat brain nuclei: a dose––response study. Versteeg DH, et al. **Brain Res** 1982 Jan 14; 231(2):343–51

Purkinje cell loss and the noradrenergic system in the cerebellum of pcd mutant mice. Ghetti B, et al. **Brain Res Bull** 1981 Dec;7(6):711–4

Dual influence of hydralazine on constrictor response to noradrenaline in isolated arterial smooth muscle. Krishnamurty VS. **Can J Physiol Pharmacol** 1981 Nov;59(11):1159–69

2,4–Dinitrophenol––mechanism of action. El–Guindy MM, et al. **Cell Mol Biol** 1981;27(5):399–402

Alterations in noradrenergic function during clorgyline treatment. Pickar D, et al. **Commun Psychopharmacol** 1980;4(5):379–86

Modification of the drug talking behavior in rats by interference in the metabolism of 5–hydroxytryptamine and catecholamines. Fuchs V, et al. **Drug Alcohol Depend** 1981 Nov;8(3):235–44

Norepinephrine in Graafian follicles is depleted by follicle–stimulating hormone. Ben–Jonathan N, et al. **Endocrinology** 1982 Feb; 110(2):457–61

Involvement of alpha 1–adrenergic receptors in the inhibitory effect of catecholamines on the thyrotropin–induced release of thyroxine by the mouse thyroid. Muraki T, et al. **Endocrinology** 1982 Jan;110(1):51–4

Evidence for involvement of alpha–adrenergic receptors in norepinephrine–induced prostaglandin E2 and luteinizing hormone–releasing hormone release from the median eminence. Ojeda SR, et al. **Endocrinology** 1982 Feb;110(2):409–12

Norepinephrine mobilization of free fatty acids in endurance trained rats. Thibault MC, et al. **Eur J Applied Physiol** 1981;47(4):313–22

Rat prolactin and hypothalamic catecholamine nerve terminal systems. Evidence for rapid and discrete increases in dopamine and noradrenaline turnover in the hypophysectomized male rat. Andersson K, et al. **Eur J Pharmacol** 1981 Dec 3;76(2–3):261–5

Acute thyroid hormone increases noradrenergic responsiveness of rat atria in vitro. Eiden LE, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):91–3

ACTH1–24 increases stimulation–evoked noradrenaline release from sympathetic nerves by acting on presynaptic ACTH receptors. Göthert M. **Eur J Pharmacol** 1981 Dec 3;76(2–3):295–6

D–Amphetamine at low doses suppresses noradrenergic functions. Huang YH, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):187–95

Noradrenaline–octopamine interactions on cortical neurones in the rat. Jones RS. **Eur J Pharmacol** 1982 Jan;77(2–3):159–62

Calcium ions, morphine tolerance and noradrenergic transmission in the mouse vas deferens. Marshall I, et al. **Eur J Pharmacol** 1981 Nov 5; 75(4):205–13

Effect of norepinephrine uptake blocker on beta–adrenergic receptors of the rat cerebral cortex. Sethy VH, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):53–6

An improved pharmacological procedure for depletion of noradrenaline: pharmacology and assessment of noradrenaline–associated behaviors. Zolovick AJ, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):265–71

Aging effect on the noradrenaline content of rat brain microvessels. Embree LJ, et al. **Exp Aging Res** 1981 Fall;7(3):215–24

Complete cold substitution of noradrenaline–induced thermogenesis in the Djungarian hamster, Phodopus sungorus. Böckler H, et al. **Experientia** 1982 Feb 15;38(2):261–2

Chronic exercise does not alter the chronotropic response of isolated rat atria to catecholamines. Smith DC, et al. **Experientia** 1982 Feb 15; 38(2):260–1

Effect of diethylpyrocarbonate on pH–driven monoamine uptake by chromaffin granule ghosts. Isambert MF, et al. **FEBS Lett** 1981 Dec 21;136(1):13-8

A regional difference in the in vitro response of the rabbit vena cava to norepinephrine. Hellegouarch A, et al. **Gen Pharmacol** 1982; 13(1):41-3

Age differences in blood pressure and norepinephrine concentration in normotensive rats after higher doses of estrogen. Lew GM. **Gen Pharmacol** 1982;13(1):75-8

Sites of noradrenergic innervation of the jejunal villus. Thomas EM, et al. **Gen Pharmacol** 1982;13(1):67-9

Quantitative evidence for cochlear, non-neuronal norepinephrine. Rarey KE, et al. **Hear Res** 1981 Sep;5(1):101-8

Distribution and significance of norepinephrine in the lateral cochlear wall of pigmented and albino rats. Rarey KE, et al. **Hear Res** 1982 Jan;6(1):15-23

Associations between rates of urinary catecholamine excretion and aspects of lifestyle among adult women in some Oxfordshire villages. Harrison GA, et al. **Hum Biol** 1981 Dec;53(4):617-33

Release and vasoactive actions of catecholamines during inhibition of prostaglandin synthesis in normal man. Vierhapper H, et al. **Hypertension** 1982 Jan-Feb;4(1):112-7

Plasma catecholamines in trained and untrained volunteers during graduated exercise. Lehmann M, et al. **Int J Sports Med** 1981 Aug; 2(3):143-7

Blood flow and O2 uptake in dog hindlimb with anemia, norepinephrine, and propranolol. Chapler CK, et al. **J Appl Physiol** 1981 Sep; 51(3):565-70

Pharmacology of arterioles: some aspects of variability in response to norepinephrine, histamine, and 5-hydroxytryptamine. Burrows ME, et al. **J Cardiovasc Pharmacol** 1981 Nov-Dec;3(6):1370-80

Influence of disopyramide, compared with procainamide and quinidine, on isolated dog arteries in response to transmural stimulation and norepinephrine. Toda N, et al. **J Cardiovasc Pharmacol** 1981 Nov-Dec; 3(6):1332-41

Cat pial venoconstriction by topical microapplication of norepinephrine. Ulrich K, et al. **J Cereb Blood Flow Metab** 1982;2(1):109-11

Gas chromatographic method for the simultaneous determination of dopamine and norepinephrine metabolites. Chauhan MS, et al. **J Chromatogr** 1982 Feb 12;227(2):323-30

The effects of age on the plasma catecholamine response to mental stress in man. Barnes RF, et al. **J Clin Endocrinol Metab** 1982 Jan; 54(1):64-9

Identification of and interactions between noradrenergic and serotonergic neurites in the myenteric plexus. Gershon MD, et al. **J Comp Neurol** 1982 Feb 1;204(4):407-21

Effects of estradiol on norepinephrine and prostaglandin efflux in medial basal hypothalamus of ovariectomized rats. Cardinali DP, et al. **J Neural Transm** 1982;53(1):39-47

Influence of innervation on the levels of noradrenaline and serotonin in the circumvallate papilla of the rat. Cano J, et al. **J Neurobiol** 1982 Jan;13(1):1-7

The effects of chronic manganese chloride treatment expressed as age-dependent, transient changes in rat brain synaptosomal uptake of amines. Lai JC, et al. **J Neurochem** 1982 Mar;38(3):844-7

Unstimulated and amphetamine-stimulated release of endogenous noradrenaline and dopamine from rat brain in vivo. Philips SR, et al. **J Neurochem** 1982 Apr;38(4):1106-10

Brain (Na+, K+)-ATPase and noradrenergic activity: effects of hyperinnervation and denervation on high-affinity ouabain binding. Swann AC, et al. **J Neurochem** 1982 Mar;38(3):836-9

Control of noradrenaline release from hippocampal synaptosomes. West DP, et al. **J Neurochem** 1981 Oct;37(4):1052-3

Neonatal hormone treatment and maturation of the pineal noradrenergic system: hydrocortisone and thyroxine. Yuwiler A, et al. **J Neurochem** 1981 Oct;37(4):985-92

Evidence for a neurotropic role of noradrenaline neurons in the postnatal development of rat cerebral cortex. Felten DL, et al. **J Neurocytol** 1982 Feb;11(1):119-35

Disparate effects of infused nutrients on delayed glucoprivic feeding and hypothalamic norepinephrine turnover. Bellin SI, et al. **J Neurosci** 1981 Dec;1(12):1347-53

Neuronal cell surfaces: distinctive glycoproteins of cultured adrenergic and cholinergic sympathetic neurons. Braun SJ, et al. **J Neurosci** 1981 Dec;1(12):1397-406

Specific uptake of norepinephrine and dopamine by homogenates of rat cerebral cortex after locus ceruleus lesion. Logan WJ, et al. **J Neurosci** 1982 Mar;2(3):394-8

The role of gustatory and postingestive signals in the termination of delayed glucoprivic feeding and hypothalamic norepinephrine turnover. Ritter S, et al. **J Neurosci** 1981 Dec;1(12):1354-60

Development and aging of noradrenergic cell bodies and axon terminals in the chicken. Yurkewicz L, et al. **J Neurosci Res** 1981;6(5):621-41

Influence of dietary zinc on rat brain catecholamines. Wallwork JC, et al. **J Nutr** 1982 Mar;112(3):514-9

Modulation of central noradrenaline release by postsynaptic receptors. Wyllie MG, et al. **J Pharm Pharmacol** 1982 Jan;34(1):53-5

Effect of delta9-tetrahydrocannabinol on the synthesis of dopamine and norepinephrine in mouse brain synaptosomes. Bloom AS. **J Pharmacol Exp Ther** 1982 Apr;221(1):97-103

Evidence for the existence of two distinct pools of intracellular calcium in the rat aorta accessible to mobilization by norepinephrine. Heaslip RJ, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):7-13

gamma-Aminobutyric acid (GABA) receptor stimulation. III. Effect of progabide (SL 76002) on norepinephrine, dopamine and 5-hydroxytryptamine turnover in rat brain areas. Scatton B, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):678-88

Developmental changes in the accumulation of norepinephrine and the chronotropic effects of catecholamines in isolated rat atria as influenced by dietary lipid. Wince LC, et al. **J Pharmacol Exp Ther** 1982 Feb; 220(2):340-6

Changes in plasma noradrenaline and adrenaline associated with central and peripheral thermal stimuli in the pig. Barrand MA, et al. **J Physiol (Lond)** 1981 Jul;316:139-52

Motor activity of the human Fallopian tube in vitro in relation to plasma concentration of oestradiol and progesterone, and the influence of noradrenaline. Helm G, et al. **J Reprod Fertil** 1982 Jan;64(1):233-42

Dobutamine-induced facilitation of norepinephrine efflux from spiral strips of guinea pig pulmonary arteries. Goshima Y, et al. **Jpn J Pharmacol** 1981 Dec;31(6):1091-4

Enhancement of calorigenic response to cold and to norepinephrine in physically trained rats. Hirata K, et al. **Jpn J Physiol** 1981; 31(5):657-65

Developmental difference in noradrenaline and 3-methoxy-4-hydroxyphenylethyleneglycol sulfate (MHPG-SO4) levels in rat whole brain. Kohno Y, et al. **Kurume Med J** 1981; 28(1):95-8

Physiological effects of bed rest [letter] Natelson BH, et al. **Lancet** 1982 Jan 2;1(8262):51

Neurotensin-induced release of endogenous noradrenaline from rat hypothalamic slices. Okuma Y, et al. **Life Sci** 1982 Jan 4; 30(1):77-84

Release of 3H-norepinephrine by ammonium and its modification by changes in pH. Wakade AR, et al. **Life Sci** 1981 Dec 7; 29(23):2381-9

Forebrain catecholamine concentrations in the rat after neocortical and hippocampal lesions. Woodruff ML, et al. **Life Sci** 1981 Dec 21; 29(25):2603-7

Activity of noradrenergic neurons of preoptic-anterior hypothalamic area of female rabbits in some stages of reproduction. Chomicka LK, et al. **Mater Med Pol** 1980 Jan-Jun;12(1-2):97-101

Cimetidine alters plasma catecholamine levels and cortisol and aldosterone excretion [letter] Feely J, et al. **N Engl J Med** 1982 Apr 29; 306(17):1054

3H-noradrenaline release potentiated in a clonal nerve cell line by low-intensity pulsed magnetic fields. Dixey R, et al. **Nature** 1982 Mar 18;296(5854):253-6

A kinetic study of the release of noradrenaline by tyramine. Brandao F, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec; 318(2):83-7

The disposition of 3H-(—)noradrenaline in the perfused cat and rabbit heart. Graefe KH. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec; 318(2):71-82

Tetanus toxin and botulinum A neurotoxin inhibit and at higher concentrations enhance noradrenaline outflow from particulate brain cortex in batch. Habermann E. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(2):105-11

Analysis of the effects of dopamine and noradrenaline in relation to the proposed postsynaptic dopamine receptor in rat vas deferens. Langeloh A, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb; 318(3):202-9

3H-Noradrenaline and 3H-5-hydroxytryptamine release from rat brain slices and its presynaptic alpha-adrenergic modulation after long-term desipramine pretreatment. Schoffelmeer AN, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):173-80

Metabolism of endogenous and exogenous noradrenaline in guinea-pig atria. Starke K, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov; 317(3):193-8

Deamination of released 3H-noradrenaline in the canine saphenous vein. Verbeuren TJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb; 318(3):148-57

Release of noradrenaline by one pulse: modulation of such release by alpha-adrenoceptor antagonists and uptake blockers. Wakade AR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981;317(4):302-9

Characteristics of the norepinephrine-stimulated phosphatidylinositol turnover in rat pineal cell dispersions. Hauser G, et al. **Neurochem Res** 1981 Oct;6(10):1067-79

Antiestrogen-induced alterations of hypothalamic dopamine and norepinephrine levels in the female rat. Baksi SN, et al. **Neuropharmacology** 1981 Dec;20(12A):1163-7

Correlation between the rate of avoidance conditioning and the brain catecholamine level in rats. Saul'skaya NB. **Neurosci Behav Physiol** 1981 May-Jun;11(3):221-6

On the interactive role of central noradrenaline neurons and corticosterone in two-way active avoidance acquisition in the rat. Archer T, et al. **Neurosci Lett** 1981 Dec 23;27(3):341–6

Is noradrenaline a major catecholamine in the bovine retina? Nesselhut T, et al. **Neurosci Lett** 1982 Jan 22;28(1):41–5

Ionic mechanisms of alpha-autoinhibition of [3H]noradrenaline secretion in guinea-pig vas deferens: possible role of extracellular sodium. Stjärne L. **Neuroscience** 1981;6(12):2759–71

The influence of ingested aluminum upon norepinephrine and dopamine levels in the rat brain. Wenk GL, et al. **Neurotoxicology (Park Forest II)** 1981 Oct;2(2):347–53

Neonatal adaptation: sympatho-adrenal response to umbilical cord cutting. Padbury JF, et al. **Pediatr Res** 1981 Dec;15(12):1483–7

Effects of hypothalamic knife cuts on feeding induced by paraventricular norepinephrine injections. Aravich PF, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):101–11

Effect of an amnesic dose of reserpine, syrosingopine or guanethidine on the levels of whole brain dopamine and norepinephrine in the mouse. Brown OM, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):911–4

Infant rat hyperactivity elicited by home cage bedding is unaffected by neonatal telencephalic dopamine or norepinephrine depletion. Pappas BA, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):151–4

The Neuroanatomy and pharmacology of the nucleus locus coeruleus. Grant SJ, et al. **Prog Clin Biol Res** 1981;71:5–27

[Role of postsynaptic noradrenergic receptors in the mechanism of action of antidepressants] Cuenca E. **Encephale** 1981;7(4 Suppl):397 (Fre)

[Antinoradrenergic activity of raubasine on isolated thoracic aorta and vas deferens of rat (author's transl)] Roquebert J, et al. **J Pharmacol** 1981 Nov–Dec;12(4):393–403 (Eng. Abstr.) (Fre)

[Effects of adrenaline, noradrenaline and isoprenaline administration on carbohydrate and lipid metabolism parameters in swine blood plasma] Brenner KV, et al. **Arch Exp Veterinarmed** 1981;35(5):697–706 (Eng. Abstr.) (Ger)

[The aerobic and anaerobic capacity of adolescents and catecholamine excretion during prolonged submaximal exercise (author's transl)] Lehmann M, et al. **Eur J Applied Physiol** 1982;48(1):135–45 (Eng. Abstr.) (Ger)

[On the National Institute of Hygienic Sciences Standard (Japanese Pharmacopoeia Standard) 'Epinephrine Bitartrate Reference Standard (Control 781)' and 'Norepinephrine Bitartrate Reference Standard (Control 791)' (author's transl)] Kimura T, et al. **Eisei Shikenjo Hokoku** 1981;99:118–21 (Eng. Abstr.) (Jpn)

[The effects of the angiotensin converting enzyme inhibitor, captopril, on catecholamine concentrations in rat plasma, heart, brain and kidneys (author's transl)] Hirata Y, et al. **Nippon Naibunpi Gakkai Zasshi** 1981 Aug 20;57(8):1097–108 (Eng. Abstr.) (Jpn)

[Effects of adrenaline, noradrenaline and pilocarpine on the oxygen uptake in rat submandibular gland (author's transl)] Sakamoto S, et al. **Nippon Seirigaku Zasshi** 1981;43(10):469–78 (Eng. Abstr.) (Jpn)

[Effect of catecholamines on the morphological picture of the peripheral autonomic nervous system of the digestive tract of rats—light-microscopical study] Jędrzejewska A, et al. **Patol Pol** 1981;32(2):233–42 (Eng. Abstr.) (Pol)

[Urinary noradrenaline excretion in workers exposed to mechanical vibration and occupational noise] Sroczyński J, et al. **Pol Tyg Lek** 1981 Sep 7;36(36):1387–8 (Eng. Abstr.) (Pol)

[Dynamics of noradrenaline concentration in the hepatic portal vein and atria of rats during stress] Manukhina EB, et al. **Biull Eksp Biol Med** 1981 Dec;92(12):673–4 (Eng. Abstr.) (Rus)

[Changes in the activity of the brain monoaminergic systems in adaptation to high altitude] Gromova EA, et al. **Dokl Akad Nauk SSSR** 1982;262(1):245–7 (Rus)

[Adaptation of the peripheral organs of rats to noradrenaline deficiency following chronic desympathization] Berdysheva LV, et al. **Fiziol Zh SSSR** 1981 Nov;67(11):1636–42 (Eng. Abstr.) (Rus)

[Changes in intraocular pressure following local injection of catecholamines into the hypothalamus] Danilov GE, et al. **Fiziol Zh SSSR** 1981 Oct;67(10):1487–92 (Eng. Abstr.) (Rus)

[Effect of exertion on trace effects of acclimatization to cold] Sobolev VI, et al. **Fiziol Zh SSSR** 1981 Nov;67(11):1710–6 (Rus)

[Changes in the catecholamine content in adrenaline-synthetizing structures of the medulla oblongata in rats with different reactions to long-term immobilization] Kvetnanskiĭ R, et al. **Probl Endokrinol (Mosk)** 1981;27(6):58–63 (Eng. Abstr.) (Rus)

NORMETANEPHRINE

Postmortem changes of normetanephrine determined by a mass-fragmentographic technique in different rat brain areas. Mocchetti I, et al. **J Neurochem** 1981 Dec;37(6):1607–9

NORTRIPTYLINE

Nortriptyline therapy in elderly patients: dosage prediction from plasma concentration at 24 hours after a single 50 mg dose. Dawling S, et al. **Br J Psychiatry** 1981 Nov;139:413–6

Interaction of chlorpromazine and nortriptyline in patients with schizophrenia. Loga S, et al. **Clin Pharmacokinet** 1981 Nov–Dec;6(6):454–62

Demethylation and hydroxylation of amitriptyline, nortriptyline, and 10-hydroxyamitriptyline in human liver microsomes. Mellström B, et al. **Drug Metab Dispos** 1981 Nov–Dec;9(6):565–8

Treatment of unstable detrusor (irritable bladder) using fluphenazine and nortriptyline: progress report. Martin MR, et al. **Prog Clin Biol Res** 1981;78:335–8

Binding of amitriptyline and nortriptyline in plasma determined from their equilibrium distributions between red cells and plasma, and between red cells and buffer solution. Burch JE, et al. **Psychopharmacology (Berlin)** 1981;75(3):262–72

[Comparison of the effectiveness of tranylcypromine, nortriptyline, thioridazine and amitriptyline in two syndromological types of endogenous depression (author's transl)] Náhunek K, et al. **Cesk Psychiatr** 1981;77(4):245–52 (Eng. Abstr.) (Cze)

OBSESSIVE–COMPULSIVE DISORDER

Successful treatment of obsessive–compulsive disorder with clonidine hydrochloride. Knesevich JW. **Am J Psychiatry** 1982 Mar;139(3):364–5

Clomipramine and exposure for chronic obsessive–compulsive rituals: III. Two year follow-up and further findings. Mawson D, et al. **Br J Psychiatry** 1982 Jan;140:11–8

The psychopharmacological treatment of obsessive–compulsive disorder: a review. Insel TR, et al. **J Clin Psychopharmacol** 1981 Sep;1(5):304–11 (68 ref.)

ORGANIC MENTAL DISORDERS

Pharmacological treatment of chronic cognitive deficit: a review. Dowson JH. **Compr Psychiatry** 1982 Jan–Feb;23(1):85–98

OXAZEPAM

Effect of pentobarbital on the formation of diastereomeric oxazepam glucuronides in man: analysis by high performance liquid chromatography. Seideman P, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):200–4

Lorazepam and oxazepam esters. Hydrophobicity, hydrolysis rates and brain appearance. Simon-Trompler E, et al. **Arzneimittelforsch** 1982;32(2):102–5

Inhibition of morphine glucuronidation by oxazepam in human fetal liver microsomes. Pacifici GM, et al. **Drug Metab Dispos** 1981 Nov–Dec;9(6):569–72

PARANOID DISORDERS

The genetics and biochemistry of paranoid schizophrenia and other paranoid psychoses. Kendler KS, et al. **Schizophr Bull** 1981;7(4):689–709 (86 ref.)

Paranoia—prognosis and treatment: a review. Ritzler BA. **Schizophr Bull** 1981;7(4):710–28 (89 ref.)

PARASYMPATHOMIMETICS

Inner plexiform circuits in the carp retina: effects of cholinergic agonists, GABA, and substance P on the ganglion cells. Glickman RD, et al. **Brain Res** 1982 Feb 18;234(1):81–99

Synthesis and selective activity of cholinergic agents with rigid skeletons. III. Takemura S, et al. **Chem Pharm Bull (Tokyo)** 1981 Oct;29(10):3026–32

Synthesis and selective activity of cholinergic agents with rigid skeletons. II. Takemura S, et al. **Chem Pharm Bull (Tokyo)** 1981 Oct;29(10):3019–25

Effects of cholinergic agents on rat liver plasma membrane guanylate cyclase. Lippo de Becemberg I, et al. **FEBS Lett** 1982 Jan 25;137(2):303–6

Effects of parasympathomimetic and sympathomimetic drugs on the secretion and composition of rat sublingual saliva. Abe K, et al. **J Dent Res** 1982 Jan;61(1):52–6

Physiological calcium ion concentration and a cholinergic drug on activity of particulate guanylate cyclase in guinea pig taenia caecum. Hisayama T, et al. **J Pharmacobiodyn** 1981 Sep;4(9):738–41

Relationships between chemical structure and cholinergic activities of furmethides and potentiation of these activities by physostigmine. Chaturvedi AK, et al. **Pharmacol Res Commun** 1981 Oct;13(9):829–45

Effects of cholinomimetics, cholinolytics and atypical antidepressants in the behavioral despair test in the rat. Herman ZS, et al. **Pol J Pharmacol Pharm** 1981;33(5):485–9

Psychopharmacological effects of cholinomimetic agents administered into hippocampus and various hypothalamic areas in the rat. Thesis. Plech A. **Pol J Pharmacol Pharm** 1981;33(4):415–20

An EEG analysis of convulsive activity produced by cholinergic agents. Cohen SL, et al. **Prog Neuropsychopharmacol** 1981;5(4):383–8

PARGYLINE

Possible hazards in serotonin binding assays in human and rat brain: effects of ascorbate, pargyline, and buffer concentration. Weiner N, et al. **J Neurosci Methods** 1982 Jan;5(1-2):41-5

PEMOLINE

Gas/liquid chromatographic analysis of pemoline in biological fluids using electron capture detection. Igwe OJ, et al. **J Chromatogr Sci** 1981 Dec; 19(12):617-24

PENTOBARBITAL

Effects of sodium pentobarbital, ketamine, halothane, and chloralose on brainstem auditory evoked responses. Cohen MS, et. al. **Anesth Analg (Cleve)** 1982 Apr;61(4):338-43

Difference in tolerance development of hypothermia and pentobarbital-induced sleep prolongating effect of 11-hydroxy-delta 8-tetrahydrocannabinol and 11-oxo-delta 8-tetrahydrocannabinol in mice. Watanabe K, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):53-6

Manganese prolongation of pentobarbital hypnosis in the male rat. Deimling MJ, et al. **Experientia** 1981 Dec 15;37(12):1322-3

Effects of pentobarbital on contractile responses of feline cerebral arteries. Edvinsson L, et al. **J Cereb Blood Flow Metab** 1981;1(4):437-40

Simple, rapid and sensitive reversed-phase high-performance liquid chromatographic method for thiopental and pentobarbital determination in plasma and brain tissue. Shiu GK, et al. **J Chromatogr** 1982 Jan 8; 227(1):207-12

Further studies on the determinant role of brain level of pentobarbital for the development of acute hypnotic tolerance. Kaneto H, et al. **J Pharmacobiodyn** 1981 Sep;4(9):700-5

Dispositional without functional tolerance to the hypothermic effects of pentobarbital in the rat. Commissaris RL, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):536-9

Effects of ethinyl estradiol on pharmacokinetics of meperidine and pentobarbital in the rat. Knodell RG, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):1-6

Personality factors in human drug self-administration. Pickens RW, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1981 Jul;(37):45-62

Orally delivered pentobarbital as a reinforcer for rhesus monkeys with concurrent access to water: effects of concentration, fixed-ratio size, and liquid positions. DeNoble VJ, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):113-7

Phencyclidine in combination with pentobarbital: supra-additive effects on complex operant behavior in patas monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):159-65

Acute and chronic effects of pentobarbital on 5-hydroxytryptamine in mouse brain. Nabeshima T, et al. **Prog Neuropsychopharmacol** 1981; 5(4):373-81

Selective blockade of the discriminative stimulus effects of pentobarbital in pigeons. Herling S, et al. **Psychopharmacology (Berlin)** 1981; 75(3):321-3

Effects of pentobarbital on punished behavior: persistent increases with chronic administration. Witkin JM, et al. **Psychopharmacology (Berlin)** 1981;75(3):324-5

[The blocking potencies and the mode of blockade by pentobarbital and phenobarbital, examined on various types of ACh-receptor activities (author's transl)] Somei K. **Nippon Seirigaku Zasshi** 1981; 43(11):529-31 (Eng. Abstr.) **(Jpn)**

PEPTIDES

Chemical modification of peptides by hydrazine. Honegger A, et al. **Biochem J** 1981 Oct 1;199(1):53-9

Interaction of alpha-dansylated peptide inhibitors with porcine pepsin: detection of complex formation by fluorescence energy transfer and chromatography and evidence for a two-step binding scheme. Dunn BM, et al. **Biochemistry** 1981 Dec 8;20(25):7206-11

Chemical cleavage of tryptophanyl and tyrosyl peptide bonds via oxidative halogenation mediated by o-iodosobenzoic acid. Fontana A, et al. **Biochemistry** 1981 Nov 24;20(24):6997-7004

Effects of somatostatin and urotensin II on tilapia pituitary prolactin release and interactions between somatostatin, osmotic pressure Ca++, and adenosine 3',5'-monophosphate in prolactin release in vitro. Grau EG, et al. **Endocrinology** 1982 Mar;110(3):910-5

Bombesin stimulates prolactin and growth hormone release by pituitary cells in culture. Westendorf JM, et al. **Endocrinology** 1982 Feb; 110(2):352-8

Biosynthesis of pairs of peptides related to melanotropin, corticotropin and endorphin in the pars intermedia of the amphibian pituitary gland. Martens GJ, et al. **Eur J Biochem** 1982 Feb;122(1):1-10

Rat isolated mesenteric artery: a sensitive preparation for the bioassay of urotensin I. Muramatsu I, et al. **Gen Comp Endocrinol** 1981 Dec; 45(4):446-52

Abnormalities of the colonic regulatory peptides in Hirschsprung's disease. Bishop AE, et al. **Histopathology** 1981 Nov;5(6):679-88

Comparative study on biological activities of various anaphylatoxins (C4a, C3a, C5a). Investigations on their ability to induce platelet secretion. Meuer S, et al. **Inflammation** 1981 Dec;5(4):263-73

C3a-induced lysosomal enzyme secretion from human neutrophils: lack of inhibition by f met-leu-phe antagonists and inhibition by arachidonic acid antagonists. Showell HJ, et al. **Int Arch Allergy Appl Immunol** 1982 Mar;67(3):227-32

Low zone desensitization: a stimulus-specific control mechanism of cell response. Investigations on anaphylatoxin-induced platelet secretion. Meuer S, et al. **J Exp Med** 1982 Mar 1;155(3):698-710

Role of brain peptides in the control of pituitary hormone release. McCann SM, et al. **Mater Med Pol** 1980 Jan-Jun;12(1-2):47-52

Stimulation of tyrosine-specific phosphorylation by platelet-derived growth factor. Ek B, et al. **Nature** 1982 Feb 4;295(5848):419-20

Peptides and the new endocrinology. Schwyzer R. **Naturwissenschaften** 1982 Jan;69(1):15-20

Developmental changes in bombesin, substance P, somatostatin and vasoactive intestinal polypeptide in the rat brain. McGregor GP, et al. **Neurosci Lett** 1982 Jan 22;28(1):21-7

Inverse relationship between onset and duration of EEG effects of six peripherally administered peptides. Miller LH, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):845-8

A proposed role for prostaglandins in the modulation of the relaxation response to urotensin I in isolated rat arteries. Gerritsen ME, et al. **Prostaglandins** 1981 Dec;22(6):873-92

CNS mediated inhibition of gastric secretion by bombesin: independence from interaction with brain catecholaminergic, and serotoninergic pathways and pituitary hormones. Taché Y, et al. **Regul Pept** 1982 Jan; 3(1):51-9

Presence of ranatensin-like and bombesin-like peptides in amphibian brains. Walsh JH, et al. **Regul Pept** 1982 Jan;3(1):1-13

[Peptide bond synthesis catalyzed by various proteases (author's transl)] Morihara K. **Tanpakushitsu Kakusan Koso** 1981 Oct;26(13):1979-98 (78 ref.) **(Jpn)**

[Peptides as carriers of information in psychiatric diseases] Reichelt KL. **Nord Med** 1980 Nov;95(11):283-6 **(Nor)**

[Neuropeptides: the history of their study and the prospects for their use in medicine] Bakalkin GIa, et al. **Bol Serv Odontol Saint (Porto Alegre)** 1981;4(2):100-5 (Eng. Abstr.) **(Rus)**

PERPHENAZINE

Estrogen in high doses inhibits perphenazine-induced prolactin release. Sinha YN, et al. **Endocrinology** 1982 Jan;110(1):126-30

PHENCYCLIDINE

Novel thin-layer chromatographic visualization reagent for phencyclidine [letter] King DL, et al. **Clin Chem** 1982 Jan;28(1):247

Phencyclidine (PCP)-structure versus reactivity. Budd RD. **Clin Toxicol** 1981;18(9):1033-41

Stability of phencyclidine in stored blood. Clardy DO, et al. **Clin Toxicol** 1981 Aug;18(8):929-34

Occupational intoxication and long-term persistence of phencyclidine (PCP) in law enforcement personnel. Pitts FN Jr, et al. **Clin Toxicol** 1981;18(9):1015-20

Effects of acute and chronic administration of phencyclidine on dopaminergic receptors in rat striatum. Leelavathi DE, et al. **Commun Psychopharmacol** 1980;4(5):417-24

Detection and quantitation of phencyclidine in rat parotid saliva and plasma. Digregorio GJ, et al. **Drug Alcohol Depend** 1981 Sep; 8(2):169-73

Effects of phencyclidine on excitatory amino acid activation of spinal interneurones in the cat. Lodge D, et al. **Eur J Pharmacol** 1982 Jan; 77(2-3):203-4

Stereospecific displacement of [3H]phencyclidine (PCP) receptor binding by an enantiomeric pair of PCP analogs. Quirion R, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):107-8

Phenylclindine-induced alteration in rat muscarinic cholinergic receptor regulation. Ward D, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2-3):189-93

Unlimited access intravenous drug self-administration in rhesus monkeys. Balster RL, et al. **Fed Proc** 1982 Feb;41(2):211-5

Phencyclidine discrimination in the pigeon using color tracking under second-order schedule. McMillan DE, et al. **J Exp Anal Behav** 1982 Jan;37(1):143-7

Nitrogen-phosphorous detection of phencyclidine in blood serum. Stavchansky S, et al. **J Pharm Sci** 1982 Feb;71(2):194-6

Phencyclidine in combination with pentobarbital: supra-additive effects on complex operant behavior in patas monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):159-65

The behavioral effects of phencyclidines may be due to their blockade of potassium channels. Albuquerque EX, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7792-6

PHENCYCLIDINE ABUSE

Physostigmine and haloperidol treatment of acute phencyclidine intoxication. Castellani S, et al. **Am J Psychiatry** 1982 Apr; 139(4):508–10

Physostigmine treatment of acute phencyclidine intoxication. Castellani S, et al. **J Clin Psychiatry** 1982 Jan;43(1):10–1

PHENELZINE

Phenelzine treatment without switch to mania [letter] Keitner GI. **Am J Psychiatry** 1982 Mar;139(3):386

Combined use of trimipramine and phenelzine in depression. Zetin M. **J Nerv Ment Dis** 1982 Apr;170(4):246–7

PHENETHYLAMINES

The effect of PEA on serotonin and catecholamines. Widelitz MM, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):1107–11

Deuterium isotope effects on the enzymatic oxidative deamination of trace amines. Yu PH, et al. **Biochem Pharmacol** 1981 Nov 15; 30(22):3089–94

Dopamine beta-hydroxylase: activity and inhibition in the presence of beta-substituted phenethylamines. Klinman JP, et al. **Biochemistry** 1982 Jan 5;21(1):67–75

Quantitative investigation on the urinary excretion and metabolism of 3,4-dimethoxyphenylethylamine in schizophrenics and normal individuals. Hempel K, et al. **Biol Psychiatry** 1982 Jan;17(1):49–59

Cation sensitivity of [125I]heat binding to alpha 1-adrenoceptors in rat cerebral cortex membranes. Glossmann H, et al. **Eur J Pharmacol** 1981 Oct 22;75(2–3):149–53

Behavioural effects of acute and chronic beta-phenylethylamine administration in the rat: evidence for the involvement of 5-hydroxytryptamine. Dourish CT. **Neuropharmacology** 1981 Nov; 20(11):1067–72

The effects of acute and chronic administration of beta-phenylethylamine on food intake and body weight in rats. Dourish CT, et al. **Prog Neuropsychopharmacol** 1981;5(4):411–4

Cross-cultural study of a biochemical abnormality in paranoid schizophrenia. Jeste DV, et al. **Psychiatry Res** 1981 Dec;5(3):341–52

Excretion of beta-phenethylamine is elevated in humans after profound stress. Paulos MA, et al. **Science** 1982 Feb 26;215(4536):1127–9

[Effect of solubilization by methylethylketone of rat liver mitochondrial monoamine oxidase on inhibition by clorgyline and deprenyl of the enzyme activity] Severina IS, et al. **Biokhimiia** 1981 Nov; 46(11):2043–55 (Eng. Abstr.) **(Rus)**

PHENOBARBITAL

On the inducibility of cytosolic and microsomal carboxylesterase by phenobarbital in rat tissues. Nousiainen U, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Jul;49(1):77–80

Effect of pentobarbital on the formation of diastereomeric oxazepam glucuronides in man: analysis by high performance liquid chromatography. Seideman P, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):200–4

Effect of phenobarbitol pretreatment on regeneration of plasma cholinesterase activity inhibited by parathion or dichlorovos. Purshottam T, et al. **Arch Environ Health** 1982 Jan–Feb;37(1):53–8

Role of haem in the induction of cytochrome P-450 by phenobarbitone. Studies in chick embryos in ovo and in cultured chick embryo hepatocytes. Giger U, et al. **Biochem J** 1981 Aug 15;198(2):321–9

Phenobarbital selectively modulates the glucagon-stimulated activity of adenylate cyclase by depressing the lipid phase separation occurring in the outer half of the bilayer of liver plasma membranes. Houslay MD, et al. **Biochem J** 1981 Sep 1;197(3):675–81

Mixed-function amine oxidase of the rat hepatocyte nuclear envelope. Demonstration and effects of phenobarbital and 3-methylcholanthrene. Sum CY, et al. **Biochem Pharmacol** 1982 Jan 1;31(1):69–73

The fate of phenobarbitone in children in hypothermia and at normal body temperature. Kadar D, et al. **Can Anaesth Soc J** 1982 Jan; 29(1):16–23

Influence of vitamin D3 status, phenobarbital, and diphenylhydantoin treatment on the plasma 25-hydroxyvitamin D3 concentrations in the rat. Gascon-Barré M, et al. **Can J Physiol Pharmacol** 1981 Oct; 59(10):1073–81

Effect of phenobarbital on sleep and nighttime plasma growth hormone and cortisol levels. Prinz PN, et al. **Can J Physiol Pharmacol** 1981 Nov; 59(11):1139–45

Effect of 2,3,7,8-tetrachlorodibenzo-p-dioxin and phenobarbital on the occurrence and distribution of four cytochrome P-450 isozymes in rabbit kidney, lung, and liver. Dees JH, et al. **Cancer Res** 1982 Apr; 42(4):1423–32

Induction of rat hepatic ornithine decarboxylase by the tumor promotors 12-O-tetradecanoylphorbol-13-acetate and phenobarbital in vivo; effect of retinyl-acetate. Bisschop A, et al. **Carcinogenesis** 1981; 2(12):1283–7

Determination of phenobarbital and phenytoin by gas-liquid chromatography with on-column methylation. Solow EB. **Clin Chem** 1982 Jan;28(1):216–8

Improved isocratic liquid-chromatographic simultaneous measurement of phenytoin, phenobarbital, primidone, carbamazepine, ethosuximide, and N-desmethylmethsuximide in serum. Szabo GK, et al. **Clin Chem** 1982 Jan;28(1):100–4

2-Propanol treatment induces selectively the metabolism of carbon tetrachloride to phosgene. Implications for carbon tetrachloride hepatotoxicity. Harris RN, et al. **Drug Metab Dispos** 1981 Nov–Dec; 9(6):551–6

Intraventricular injection of follicle-stimulating hormone (FSH) during proestrus stimulates the rise in serum FSH on estrus in phenobarbital-treated hamsters through a central nervous system-dependent mechanism. Coutifaris C, et al. **Endocrinology** 1982 Jan;110(1):105–13

The effect of antipyrine, phenobarbitol and rifampicin on thyroid hormone metabolism in man. Ohnhaus EE, et al. **Eur J Clin Invest** 1981 Oct; 11(5):381–7

Distribution of nuclear size and DNA content in serial liver biopsies of rats treated with N-nitrosomorpholine, phenobarbital and butylated hydroxytoluene. Romagna F, et al. **Exp Cell Biol** 1981;49(6):294–305

Enhancing effect of barbital on N-2-fluorenylacetamide-induced rat liver lesions. Mori H, et al. **Gan** 1981 Oct;72(5):798–801

Comparative effects of phenobarbital and picrotoxin on the choline acetyltransferase activity of specific rat brain areas. Owasoyo JO. **Gen Pharmacol** 1982;13(1):71–3

Effects of 3-methylcholanthrene, beta-naphthoflavone, and phenobarbital on the 3-methylcholanthrene-inducible isozyme of cytochrome P-450 within centrilobular, midzonal, and periportal hepatocytes. Baron J, et al. **J Biol Chem** 1982 Jan 25;257(2):953–7

Phenobarbital induction of a soluble cytochrome P-450-dependent fatty acid monooxygenase in Bacillus megaterium. Narhi LO, et al. **J Biol Chem** 1982 Mar 10;257(5):2147–50

Renal cortical accumulation of phenobarbital in rats and rabbits: lack of correlation with induction of renal microsomal monooxygenases. Kuo CH, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):547–51

Effects of sex hormones and glucocorticoids on the induction of a drug metabolizing enzyme by phenobarbital in chick embryo. Nishigori H, et al. **Life Sci** 1982 Feb 1;30(5):433–9

Reproductive dysfunction in female offspring after prenatal exposure to phenobarbital: critical period of action. Gupta C, et al. **Pediatr Res** 1981 Dec;15(12):1488–91

Changes in phospholipid methyltransferases and membrane microviscosity during induction of rat liver microsomal cytochrome P-450 by phenobarbital and 3-methylcholanthrene. Sastry BV, et al. **Pharmacology** 1981;23(4):211–22

Protection against paracetamol-induced glutathione depletion following a paracetamol-acetylsalicylic acid mixture or benorilate in phenobarbital-treated rats. De Vries J, et al. **Toxicol Lett** 1981 Dec; 9(4):345–7

Selective detoxification: hemoperfusion on antiphenobarbital antibody immobilized on solid phase. Callegaro L, et al. **Trans Am Soc Artif Intern Organs** 1981;27:566–9

[The blocking potencies and the mode of blockade by pentobarbital and phenobarbital, examined on various types of ACh-receptor activities (author's transl)] Somei K. **Nippon Seirigaku Zasshi** 1981; 43(11):529–31 (Eng. Abstr.) **(Jpn)**

[The effects of phenobarbitone on the inhibitory action of GABA (author's transl)] Kaneko S, et al. **No To Shinkei** 1982 Jan;34(1):77–84 (Eng. Abstr.) **(Jpn)**

[Liberation of active substances from suppository bases. II. In vivo studies of phenobarbital suppositories] Grzesiczak A, et al. **Acta Pol Pharm** 1981;38(4):493–7 (Eng. Abstr.) **(Pol)**

[Degradation of phenobarbital by human placenta in experiments on perfused placentas in vitroj Henneberg M, et al. **Ginekol Pol** 1981; 52(10):863–7 (Eng. Abstr.) **(Pol)**

[Effect of phenobarbital on the luminescence system of luminous bacteria] Vysotskii ES, et al. **Mikrobiologiia** 1981 Nov–Dec;50(6):985–91 (Eng. Abstr.) **(Rus)**

PHENOTHIAZINE TRANQUILIZERS

Calmodulin-dependent stimulation of the NADPH oxidase of human neutrophils. Jones HP, et al. **Biochim Biophys Acta** 1982 Jan 12; 714(1):152–6

Phenothiazines inhibit prolactin secretion in vitro. A possible role for calmodulin in stimulus–-secretion coupling in the pituitary. Merritt JE, et al. **FEBS Lett** 1981 Nov 30;135(1):107–10

PHENOTHIAZINES

Identification and characterization of a phospholipase C activity in resident mouse peritoneal macrophages. Inhibition of the enzyme by phenothiazines. Wightman PD, et al. **Biochem J** 1981 Aug 1; 197(2):523–6

Phenothiazines inhibit adenosine uptake by rat brain synaptosomes. Phillis

pages tightly bound

JW, et al. **Can J Physiol Pharmacol** 1981 Oct;59(10):1108–10

Magnetic susceptibility studies of native and thionine–oxidized molybdenum–iron protein from Azotobacter vinelandii nitrogenase. Smith JP, et al. **J Biol Chem** 1982 Mar 10;257(5):2310–3

Liquid chromatography of demoxepam and phenothiazines using a post–column photochemical reactor and fluorescence detection. Brinkman UA, et al. **J Chromatogr** 1981 Nov 6;217:463–71

Reduction of vanadate, a possible explanation of the effect of phenothiazines in manic–depressive psychosis [letter] Naylor GG, et al. **Lancet** 1982 Feb 13;1(8268):395–6

The affinity of various phenothiazine drugs for membranes of intact human erythrocytes and their membrane–transforming activity. Kanaho Y, et al. **Mol Pharmacol** 1981 Nov;20(3):704–8

[Spectrofluorimetry of some phenothiazine derivatives. II. Derivatives having no substitution in position 2 and an alkylheterocyclic one in position 10 (author's transl)] Gayte–Sorbier A, et al. **Ann Pharm Fr** 1981;39(5):435–43 (Eng. Abstr.) **(Fre)**

[In vitro biopharmaceutical control of drug preparations. 2. Comparison of various extraction–testing apparatuses with coated tablets containing Aparkazin (diethazine chloride)] Keserü P, et al. **Acta Pharm Hung** 1981 Nov;51(6):264–9 (Eng. Abstr.) **(Hun)**

PHENOXYBENZAMINE

Irreversible blockade of [3H]spiperone– but not [3H]dopamine–labeled dopamine receptors with phenoxybenzamine. Titeler M. **Biochem Pharmacol** 1981 Nov 15;30(22):3031–7

Prostatodynia––physiological characteristics and rational management with muscle relaxants. Osborn DE, et al. **Br J Urol** 1981 Dec; 53(6):621–3

Phenoxybenzamine blocks dopamine autoreceptors irreversible: implications for multiple dopamine receptor hypotheses. Lehmann J, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):247–54

The effects of phenoxybenzamine on the aortic pressure–diameter relationship in dogs. Stone DN, et al. **Experientia** 1982 Feb 15; 38(2):257–8

Bladder outflow obstruction treated with phenoxybenzamine. Abrams PH, et al. **Prog Clin Biol Res** 1981;78:269–75

PHENYLALANINE

Assay for plasma free phenylalanine and tyrosine by high–pressure liquid chromatography and field desorption mass spectrometry and its application to an in vivo study of the phenylalanine hydroxylating system in man. Lehmann WD, et al. **Biomed Mass Spectrom** 1981 Dec; 8(12):598–605

Comparative utilization of the isomers of phenylalanine and phenyllactic acid by chicks and rats. Boebel KP, et al. **J Nutr** 1982 Feb; 112(2):367–76

PHENYLBUTYRATES

Lipoprotein lipase–catalyzed hydrolysis of p–nitrophenyl butyrate. Interfacial activation by phospholipid vesicles. Shirai K, et al. **J Biol Chem** 1982 Feb 10;257(3):1253–8

PHENYLPROPANOLAMINE

Secretory otitis media, oral decongestant and antihistamine. Haugeto OK, et al. **J Otolaryngol** 1981 Oct;10(5):359–62

Stability of phenylpropanolamine hydrochloride in liquid formulations containing sugars. Barry RH, et al. **J Pharm Sci** 1982 Jan; 71(1):116–8

Phenylpropanolamine [letter] Silverman HI, et al. **JAMA** 1982 Jan 22–29; 247(4):460–1

Fluorometric determination of the D–norpseudoephedrine in the plasma. Plasma levels during the resorption from the free and extended–release form. Meyer J, et al. **Pharm Acta Helv** 1982;57(1):12–5

PHENYTOIN

The bone inductive capacity of decalcified bone matrix modified by diphenylhydantoin. Oikarinen J. **Acta Orthop Scand** 1981 Oct; 52(5):505–11

Phenytoin pharmacokinetics: inappropriate data analysis. Grasela TH, et al. **Am J Hosp Pharm** 1982 Jan;39(1):41–3

Graphic methods of predicting phenytoin dosage and plasma concentrations [letter] Wallace SM. **Am J Hosp Pharm** 1981 Dec; 38(12):1879, 1882

Bioavailability of four brands of phenytoin. Cid E, et al. **Biopharm Drug Dispos** 1981 Oct–Dec;2(4):391–4

Pharmacokinetics of phenytoin in children. Blain PG, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):659–61

A comparison of the bioavailability of two brands of phenytoin. Gibberd FB, et al. **Br J Clin Pharmacol** 1982 Mar;13(3):455–6

Plasma protein binding of phenytoin in the aged: in vivo studies. Patterson M, et al. **Br J Clin Pharmacol** 1982 Mar;13(3):423–5

Influence of vitamin D3 status, phenobarbital, and diphenylhydantoin treatment on the plasma 25–hydroxyvitamin D3 concentrations in the rat. Gascon–Barré M, et al. **Can J Physiol Pharmacol** 1981 Oct; 59(10):1073–81

Determination of phenobarbital and phenytoin by gas–liquid chromatography with on–column methylation. Solow EB. **Clin Chem** 1982 Jan;28(1):216–8

Improved isocratic liquid–chromatographic simultaneous measurement of phenytoin, phenobarbital, primidone, carbamazepine, ethosuximide, and N–desmethylmethsuximide in serum. Szabo GK, et al. **Clin Chem** 1982 Jan;28(1):100–4

Disposition of antipyrine and phenytoin correlated with age and liver volume in man. Bach B, et al. **Clin Pharmacokinet** 1981 Sep–Oct; 6(5):389–96

Fatal hydantoin syndrome: congenital malformation of the urinary tract–a case report. Michalodimitrakis M, et al. **Clin Toxicol** 1981; 18(9):1095–7

The effect of diphenylhydantoin (Dilantin) on thallium–201 chloride uptake. Schachner ER, et al. **Eur J Nucl Med** 1981 Dec;6(12):585–6

Effect of phenytoin on mitotic activity of gingival tissue and cultured fibroblasts. Al–Ubaidy SS, et al. **J Periodontol** 1981 Dec; 52(12):747–9

Phenytoin antagonism of electrically induced maximal seizures in frogs and mice and effects on central nervous system levels of adenosine 3',5'–monophosphate and guanosine 3',5'–monophosphate. Johnson SW, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):139–45

Application of spin labeling to drug assays. II. Determination of the binding of [14C]–phenytoin and spin–labeled phenytoins to albumin and human serum. Chou D, et al. **Mol Pharmacol** 1981 Nov; 20(3):674–80

Effects of sodium valproate on the serum protein binding of phenytoin, and on liver enzyme activity. Richens A, et al. **Monogr Neural Sci** 1981; 5:221–8

Preliminary pharmacological investigations of N–amino–diphenyl–hydantoin, a new hydantoin derivative with prolonged action. Rump S, et al. **Monogr Neural Sci** 1981;5:163–7

Transient antibody deficiency and abnormal t–suppressor cells induced by phenytoin. Dosch HM, et al. **N Engl J Med** 1982 Feb 18; 306(7):406–9

Binding of (3H)–5,5 diphenylhydantoin to rat brain membranes. Shah DS, et al. **Neuropharmacology** 1981 Nov;20(11):1115–9

Phenytoin intoxication and sulphonamides [letter] Paxton JW. **NZ Med J** 1981 Nov 25;94(696):396–7

Pharmacological properties of N–aminodiphenylhydantoin, a new hydantoin derivative with anticonvulsant activity. Rump S, et al. **Pharmazie** 1981 Nov;36(11):780–1

Anticonvulsant intoxication precipitated by azapropazone. Roberts CJ, et al. **Postgrad Med J** 1981 Mar;57(665):191–2

Single point estimation of phenytoin dosing: a reappraisal. Koup JR, et al. **Res Commun Chem Pathol Pharmacol** 1981 Nov;34(2):231–9

Phenytoin toxicity induced by antituberculosis drugs [letter] Sandyk R. **S Afr Med J** 1982 Mar 13;61(11):382

Effect of prenatal phenytoin administration on postnatal development of the rat: a behavioral teratology study. Elmazar MM, et al. **Teratology** 1981 Oct;24(2):115–24

Digoxin and Phenytoin analyses as part of consultations in clinical pharmacology: a study on the use of drugs. Bergman U, et al. **Ther Drug Monit** 1981;3(3):259–69

Effect of antacids on phenytoin bioavailability. Carter BL, et al. **Ther Drug Monit** 1981;3(4):333–40

Differences in single dose phenytoin kinetics between Greenland Eskimos and Danes. Kromann N, et al. **Ther Drug Monit** 1981;3(3):239–45

[Bioavailability of two commercial phenytoin preparations (author's transl)] Yahaba Y, et al. **Seishin Shinkeigaku Zasshi** 1981; 83(9):582–96 (Eng. Abstr.) **(Jpn)**

[Biopharmaceutical studies of drugs. V. Dissolution properties and bioavailability of ground mixtures of poorly water soluble drugs and soluble proteins (author's transl)] Kigasawa K, et al. **Yakugaku Zasshi** 1981 Aug;101(8):733–9 (Eng. Abstr.) **(Jpn)**

PHOBIC DISORDERS

Level of ego development and psychotherapy outcome in phobic patients. Rock MH, et al. **Br J Med Psychol** 1981 Dec;54(Pt 4):319–28

PHYSOSTIGMINE

Physostigmine's use questioned for amoxapine overdose [letter] **Am J Hosp Pharm** 1981 Dec;38(12):1882, 1889

Physostigmine and haloperidol treatment of acute phencyclidine intoxication. Castellani S, et al. **Am J Psychiatry** 1982 Apr; 139(4):508–10

Central cardiovascular effects of physostigmine in the cat; possible cholinergic aspects of blood pressure regulation. de Wildt DJ, et al. **Arch Int Pharmacodyn Ther** 1981 Sep;253(1):22–39

The influence of physostigmine on sympathetic outflow and haemodynamics by an action upon the pontomedullary region of the cat. de Wildt DJ, et al. **Arch Int Pharmacodyn Ther** 1981 Sep;

29(1):40-51

Effects of physostigmine on benzodiazepine toxicity. Ongini E, et al. **Arch Int Pharmacodyn Ther** 1981 Sep;253(1):164-76

The involvement of the catecholaminergic system in physostigmine-induced hyperactivity in rats. Egbe PC. **Arzneimittelforsch** 1982;32(1):27-9

Antagonism of ketamine by 4-aminopyridine and physostigmine [letter] Martinez-Aguirre E. **Br J Anaesth** 1982 Jan;54(1):110

Dose-dependent feeding in the rat following substantia nigra acetylcholinesterase blockade. Winn P, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):421-5

Physostigmine treatment of acute phencyclidine intoxication. Castellani S, et al. **J Clin Psychiatry** 1982 Jan;43(1):10-1

Cardiovascular response to microinjection of physostigmine and choline into the dorsal medullary site of the rat. Kubo T, et al. **Neuropharmacology** 1981 Nov;20(11):1091-5

Treatment of tricyclic poisoning [letter] Fujita P. **Pediatrics** 1981 Dec; 68(6):912

Relationships between chemical structure and cholinergic activities of [illegible] and potentiation of these activities by physostigmine. Chaturvedi AK, et al. **Pharmacol Res Commun** 1981 Oct; 13(9):829-45

[The antagonistic effect of physostigmine on sedation by lormetazepam (author's transl) Grote B, et al. **Anaesthesist** 1981 Dec;30(12):627-32 (Eng. Abstr.) (Ger)

PILOCARPINE

Regulation of intestinal goblet cell secretion. I. Role of parasympathetic stimulation. Specian RD, et al. **Am J Physiol** 1982 Apr; 242(4):G370-9

Ultrastructural stereologic analysis of fetal rabbit type II alveolar epithelial cells following maternal pilocarpine treatment or fasting. Smith DM, et al. **Anat Rec** 1982 Jan;202(1):23-31

Amylase released from the parotid gland by pilocarpine elevates the enzyme activity in the submandibular and sublingual glands of rats. Ikeno T, et al. **Experientia** 1982 Feb 15;38(2):251-2

The proportion of ribosomes engaged in rat pancreatic polysomal structures as influenced by pilocarpine injection. Poort C, et al. **J Cell Sci** 1981 Aug;50:165-9

[Study of isotonization by means of osmometry] Kovacs P, et al. **Acta Pharm Hung** 1982 Jan;52(1):22-32 (Eng. Abstr.) (Hun)

[Effects of adrenaline, noradrenaline and pilocarpine on the oxygen uptake in rat submandibular gland (author's transl)] Sakamoto S, et al. **Nippon Seirigaku Zasshi** 1981;43(10):469-78 (Eng. Abstr.) (Jpn)

PITUITARY HORMONE RELEASING HORMONES

Gonadotrophin releasing hormone causes a biphasic secretion of luteinizing hormone and follicle stimulating hormone by cultures of rat anterior pituitary cells. Eddie LW, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):44-9

The effect of gonadotropin-releasing hormone on ovarian estradiol secretion. Kletzky OA, et al. **Am J Obstet Gynecol** 1982 Feb 15; 142(4):427-31

Reduction of pituitary nucleic acids, proteins, LH and FSH by melatonin-free pineal extract in rats stimulated with gonadotropin releasing hormone. Damian E, et al. **Endocrinologie** 1981 Oct-Dec; 19(4):227-30

Interaction of gonadotropin-releasing hormone agonist and antagonist with progesterone, prolactin, or human chorionic gonadotropin during pregnancy in the rat. Rivier C, et al. **Endocrinology** 1982 Feb; 110(2):347-51

Effect of unilateral castration and unilateral cryptorchidism on gonadotropin and testosterone response to gonadotropin releasing hormone in the bull. Barnes MA, et al. **J Anim Sci** 1981 Nov; 53(5):1341-50

Diminution of the in vitro response to luteinizing hormone by corpora lutea induced by gonadotropin releasing hormone treatment of postpartum suckled beef cows. Kesler DJ, et al. **J Anim Sci** 1981 Sep; 53(3):749-54

Pituitary sensitivity to gonadotrophin releasing hormone after hyperprolactinaemia induced with neuroleptics and domperidone in the rat. Carter DA, et al. **J Endocrinol** 1981 Dec;91(3):439-46

Plasma LH and testosterone responses to synthetic gonadotrophin-releasing hormone (GnRH) or dexamethasone-GnRH combined treatment and their relationship to semen output in bulls. Abdel Malak G, et al. **J Reprod Fertil** 1982 Jan;64(1):107-13

Induction of cyclic ovarian activity in seasonally anoestrous ewes with exogenous GnRH. McNatty KP, et al. **J Reprod Fertil** 1982 Jan; 64(1):93-6

Biosynthesis, in vivo, of gonadotropin-releasing hormone in the hypothalamus of normal and ovariectomized female rats. Kochman K, et al. **Mol Cell Endocrinol** 1982 Feb;25(2):193-202

Female sexual behaviour in the GnRH deficient, hypogonadal (hpg) mouse. Ward BJ, et al. **Physiol Behav** 1981 Dec;27(6):1107-9

The hypophysiotrophic hormones. Buckingham JC. **Prog Med Chem** 1978; 15:165-210 (380 ref.)

PITUITARY HORMONES

Role of brain peptides in the control of pituitary hormone release. McCann SM, et al. **Mater Med Pol** 1980 Jan-Jun;12(1-2):47-52

In vivo thyroxine release in day-old cockerels in response to acute stimulation by mammalian and avian pituitary hormones. MacKenzie DS. **Poult Sci** 1981 Sep;60(9):2136-43

PITUITARY HORMONES, ANTERIOR

The effects of propranolol and acebutolol on the overnight plasma levels of anterior pituitary and related hormones. Lewis MJ, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):737-42

Evidence for intragranular processing of pro-opiocortin in the mouse pituitary intermediate lobe. Loh YP, et al. **Eur J Cell Biol** 1981 Dec; 26(1):177-83

PROCHLORPERAZINE

Phenothiazine biphasic effect on dopamine concentrations in the basal ganglia of subhuman primates. Bird ED, et al. **Psychiatry Res** 1982 Feb;6(1):1-6

PROGESTERONE

Effects of ovarian steroids on serotonin metabolism within grossly dissected and microdissected brain regions of the ovariectomized rat. Cone RI, et al. **Brain Res Bull** 1981 Dec;7(6):639-44

Calmodulin is involved in the first step of oocyte maturation: effects of the antipsychotic drug fluphenazine and of anticalmodulin antibodies on the progesterone-induced maturation of xenopus laevis oocyte. Cartaud A, et al. **Cell Differ** 1981 Dec;10(6):357-63

Stimulation of progesterone and prostaglandin E accumulation by luteinizing hormone-releasing hormone (LHRH) and LHRH analogs in rat granulosa cells. Clark MR. **Endocrinology** 1982 Jan; 110(1):146-52

Ovarian steroids modulate the self-priming effect of luteinizing hormone-releasing hormone on bovine pituitary cells in vitro. Padmanabhan V, et al. **Endocrinology** 1982 Mar;110(3):717-21

Interaction of gonadotropin-releasing hormone agonist and antagonist with progesterone, prolactin, or human chorionic gonadotropin during pregnancy in the rat. Rivier C, et al. **Endocrinology** 1982 Feb; 110(2):347-51

Sensitivity of pituitary and corpus luteum responses to single intranasal administration of (D-ser[TBU]6-des-gly-NH2(10)) luteinizing hormone-releasing hormone ethylamide (Buserelin) in normal women. Lemay A, et al. **Fertil Steril** 1982 Feb;37(2):193-200

Inhibin-like activity and steroid content in human follicular fluid during the periovulatory period., Lefevre B, et al. **Int J Fertil** 1981; 26(4):295-6

Inhibition of human granulosa cell progesterone secretion by a gonadotropin-releasing hormone agonist. Tureck RW, et al. **J Clin Endocrinol Metab** 1982 May;54(5):1078-80

Effects of an intermittent lighting schedule on the time of egg-laying and the levels of luteinizing hormone, progesterone and corticosterone in the plasma of the domestic hen. Duplaix M, et al. **J Endocrinol** 1981 Dec;91(3):375-83

Motor activity of the human Fallopian tube in vitro in relation to plasma concentration of oestradiol and progesterone, and the influence of noradrenaline. Helm G, et al. **J Reprod Fertil** 1982 Jan;64(1):233-42

In vivo antiglucocorticoids: Comparison between in vivo activity and in vitro competition of progestins for the glucocorticoid receptor. Naylor PH, et al. **J Steroid Biochem** 1981 Dec;14(12):1303-9

Comparison of steroid and LH-RH effects on the responsiveness of hemipituitary glands and dispersed pituitary cells. Speight A, et al. **Mol Cell Endocrinol** 1981 Dec;24(3):267-81

Cyclic AMP-mediated control of meiosis: effects of progesterone, cholera toxin, and membrane-active drugs in Xenopus laevis oocytes. Schorderet-Slatkine S, et al. **Proc Natl Acud Sci USA** 1982 Feb; 79(3):850-4

[Ureteral response, through adrenergic stimulation, to the action of progesterone and estradiol] García Sacristán A, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):129-32 (Spa)

PROLACTIN

Pattern of prolactin secretion and pituitary responsiveness to LRH in pseudopregnant rats maintained in constant light. Koiter TR, et al. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):31-8

Physiological role of endorphins in neuroendocrinology. Dupont A, et al. **Acta Physiol Pol** 1981;32(5 Suppl 23):37-57 (45 ref.)

Autoregulation of rat pituitary prolactin secretion demonstrated by a new perfusion method. Zacur HA, et al. **Am J Physiol** 1982 Apr; 242(4):E226-33

The amino acid composition of secreted mouse prolactin, growth hormone, and hamster prolactin: the presence of one tryptophan in mouse prolactin. Colosi P, et al. **Arch Biochem Biophys** 1981 Dec; 212(2):759-61

Suppression of mammotropic development and prolactin release by sympathomimetic drugs in rats. Shani J, et al. **Arch Farmacol Toxicol** 1981 Aug;7(2):201-8

Effect of domperidone on prolactin (PRL)and thyrotrophin (TSH) secretion. Kaufman JM, et al. **Arch Int Pharmacodyn Ther** 1981 Dec; 254(2):293-303

The extracerebral dopamine antagonist domperidone block the suppressive effect of bromocriptine on prolactin and TSH secretion in man. Svet-Moldavsky I, et al. **Biomedicine** 1981 Oct;35(5):142-4

Changes in prolactin binding sites in the rabbit hypothalamus induced by physiological and pharmacological variations of prolactin serum levels. Di Carlo R, et al. **Brain Res** 1981 Dec 28;230(1-2):445-50

Comparative effects of estrogens and prolactin on nigral and striatal GAD activity. Nicoletti F, et al. **Brain Res** 1982 Jan 28;232(1):238-41

Somatostatin inhibits prolactin secretion in the estradiol primed male rat. Cooper GR, et al. **Can J Physiol Pharmacol** 1981 Oct;59(10):1082-8

Immunoreactive calcitonin in maternal milk and serum in relation to prolactin and neurotensin. Werner S, et al. **Early Hum Dev** 1982 Jan; 6(1):77-82

Induction of testicular gonadotropin-releasing hormone (GnRH) receptors by GnRH: effects of pituitary hormones and relationship to inhibition of testosterone production. Bourne GA, et al. **Endocrinology** 1982 Mar;110(3):727-33

Evidence for the involvement of central epinephrine systems in the regulation of luteinizing hormone, prolactin, and growth hormone release in female rats. Crowley WR, et al. **Endocrinology** 1982 Apr; 110(4):1102-7

Inhibition of lordosis behavior in the female rat by intraventricular infusion of prolactin and by chronic hyperprolactinemia. Dudley CA, et al. **Endocrinology** 1982 Feb;110(2):677-9

Effects of somatostatin and urotensin II on tilapia pituitary prolactin release and interactions between somatostatin, osmotic pressure Ca++, and adenosine 3',5'-monophosphate in prolactin release in vitro. Grau EG, et al. **Endocrinology** 1982 Mar;110(3):910-5

Interaction of gonadotropin-releasing hormone agonist and antagonist with progesterone, prolactin, or human chorionic gonadotropin during pregnancy in the rat. Rivier C, et al. **Endocrinology** 1982 Feb; 110(2):347-51

Catecholestrogens and release of anterior pituitary gland hormones. II. Prolactin. Rodriguez-Sierra JF, et al. **Endocrinology** 1982 Feb; 110(2):325-9

Estrogen in high doses inhibits perphenazine-induced prolactin release. Sinha YN, et al. **Endocrinology** 1982 Jan;110(1):126-30

Bombesin stimulates prolactin and growth hormone release by pituitary cells in culture. Westendorf JM, et al. **Endocrinology** 1982 Feb; 110(2):352-8

Lactation-inhibiting and prolactin-lowering effect of lisuride and bromocriptine: a comparative study. Van Dam LJ, et al. **Eur J Obstet Gynecol Reprod Biol** 1981 Nov;12(5):323-30

Rat prolactin and hypothalamic catecholamine nerve terminal systems. Evidence for rapid and discrete increases in dopamine and noradrenaline turnover in the hypophysectomized male rat. Andersson K, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):261-5

ACTH1-24 counteracts the prolactin-releasing effect of an opioid. Ferri S, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):143-5

Sulpiride effects on nigral and striatal glutamic acid decarboxylase activity: a possible involvement of prolactin. Nicoletti F, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):131-5

Phenothiazines inhibit prolactin secretion in vitro. A possible role for calmodulin in stimulus—secretion coupling in the pituitary. Merritt JE, et al. **FEBS Lett** 1981 Nov 30;135(1):107-10

Pituitary hormonal response to the orthopramides clebopride, bromopride, metoclopramide, and sulpiride. Pérez-López FR, et al. **Fertil Steril** 1982 Mar;37(3):445-8

Differential effects of bromocriptine treatment on LH release and copulatory behavior in hyperprolactinemic male rats. Doherty PC, et al. **Horm Behav** 1981 Dec;15(4):436-50

Prolactin responsiveness to repeated decremental doses of sulpiride. Tormey WP, et al. **Horm Metab Res** 1981 Aug;13(8):454-5

Prolactin suppression and spermatogenic developments in maturing rats. A quantitative study. Nag S, et al. **Horm Res** 1981;15(2):72-7

Prolactin resistance to bromocryptine treatment: a case report. Borenstein R, et al. **Int J Fertil** 1981;26(4):287-9

Combined bromocryptine and hMG treatment in hyperprolactinemic infertility. Katz Z, et al. **Int J Fertil** 1981;26(4):290-2

Failure of stress and supplemental lighting to affect release of prolactin in swine. Hoagland TA, et al. **J Anim Sci** 1981 Aug;53(2):467-72

Pituitary sensitivity to gonadotrophin releasing hormone after hyperprolactinaemia induced with neuroleptics and domperidone in the rat. Carter DA, et al. **J Endocrinol** 1981 Dec;91(3):439-46

Neurotransmitter effects on release of prolactin and growth hormone in vitro from pituitary glands of the pigeon, Columba livia. Hall TR. **J Endocrinol** 1982 Feb;92(2):303-8

Drug-induced hyperprolactinaemia and discharges of luteinizing hormone evoked by oestrogen in ovariectomized rhesus monkeys. Martensz ND, et al. **J Endocrinol** 1982 Jan;92(1):111-22

Circadian rhythmicity of prolactin secretion in elderly subjects: changes during bromocriptine treatment. Polleri A, et al. **J Endocrinol Invest** 1981 Jul-Sep;4(3):317-21

In-vivo and in-vitro effects of domperidone on the release of prolactin and LH in male and female rats. Carter DA, et al. **J Reprod Fertil** 1982 Jan;64(1):191-7

Influence of adrenocorticotropin and adrenalectomy on gonadotropin secretion in immature rats. Mann DR, et al. **Neuroendocrinology** 1982 Jan;34(1):20-6

Temporal and other effects of catechol estrogens on prolactin secretion in the rat. Shin SH, et al. **Neuroendocrinology** 1981 Dec;33(6):352-7

The effect of monoamine oxidase A and B inhibitors on rat serum prolactin. Keane PE, et al. **Neuropharmacology** 1981 Dec; 20(12A):1157-62

Rapid glucocorticoid inhibition of vasoactive intestinal peptide-induced cyclic AMP accumulation and prolactin release in rat pituitary cells in culture. Rotsztejn WH, et al. **Proc Natl Acad Sci USA** 1981 Dec; 78(12):7584-8

Differential effects of warm- and cold-ambient temperature on blood levels of beta-endorphin and prolactin in the rat. Deeter WT 3d, et al. **Proc Soc Exp Biol Med** 1981 Dec;168(3):369-72

Hyperprolactinemia and hyperadrenocorticism accompanied by normal blood pressure in Sprague-Dawley rats. McMurtry JP, et al. **Proc Soc Exp Biol Med** 1981 Oct;168(1):114-8

Nontraditional neurotransmitters and prolactin release. Donoso AO, et al. **Prog Clin Biol Res** 1981;74:219-28 (35 ref.)

Inhibitors of prolactin secretion: a mini-review. Slaunwhite WR Jr. **Prog Clin Biol Res** 1981;75B:19-29 (42 ref.)

Tolerance to the prolactin-elevating effect of neuroleptics. Brown WA, et al. **Psychiatry Res** 1981 Dec;5(3):317-22

(Des-tyrosine1)-gamma-endorphin in schizophrenia: clinical, biochemical, and hormonal aspects. Verhoeven WM, et al. **Psychiatry Res** 1981 Dec;5(3):293-309

Growth hormone and prolactin secretion in adults and hyperactive children: relation to methylphenidate serum levels. Gualtieri CT, et al. **Psychoneuroendocrinology** 1981 Dec;6(4):331-9

[Validity of radioimmunoassay for blood and pituitary prolactin in the male rat. Effect of bromocriptine and thyrotropin-releasing hormone] André M, et al. **C R Soc Biol (Paris)** 1981;175(6):792-800 (Eng. Abstr.) (Fre)

[Clinical aspects of the sensitivity of the prolactin system to daily fluctuation] Rindt W, et al. **Methods Find Exp Clin Pharmacol** 1981; 3 Suppl 1:115S-118S (Ger)

[The effect of bromocriptine induced estradiol-17 beta in amenorrhea patients with normoprolactinemia and hyperprolactinemia (author's transl)] Kato K, et al. **Horumon To Rinsho** 1981 Aug;29(8):931-5 (Jpn)

PROMETHAZINE

Effect of promethazine hydrochloride on bone resorption in tissue culture. Goldhaber P, et al. **Proc Soc Exp Biol Med** 1982 Jan;169(1):105-9

[Metabolic interactions of promethazine (author's transl)] Pfeifer S, et al. **Pharmazie** 1981 Dec;36(12):815-8 (Eng. Abstr.) (Ger)

PROPANEDIOLS

The effect of pH, temperature and certain media constituents on the stability and activity of the preservative, bronopol. Moore KE, et al. **J Appl Bacteriol** 1981 Dec;51(3):483-94

Intracoronary propylene glycol [letter] Pepine CJ, et al. **N Engl J Med** 1982 Apr 8;306(14):868-9

Comparative short-term inhalation toxicity of ethylene glycol monomethyl ether and propylene glycol monomethyl ether in rats and mouse. Miller RR, et al. **Toxicol Appl Pharmacol** 1981 Dec; 61(3):368-77

PROPRANOLOL

Effect of chronic propranolol treatment and withdrawal on norepinephrine and tyrosine hydroxylase in sympathetic tissues. Atkins F, et al. **Arch Int Pharmacodyn Ther** 1981 Dec;254(2):271-81

Effect of L-propranolol on the binding, Internalization and degradation of 125I-low density lipoproteins by human skin fibroblasts. Ghiselli G, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):1060-8

The influence of propranolol on the concentration of heme and on the activity of delta aminolevulinate synthase in monolayers of chick embryo liver cells. Epstein O, et al. **Biochem Pharmacol** 1982 Feb 15; 31(4):485-9

Regulation of adrenergic stimulation of hepatic adenylate cyclase by divalent cations. Jackowski MM, et al. **Biochim Biophys Acta** 1982 Jan 12;714(1):74-83

The effects of propranolol and acebutolol on the overnight plasma levels of anterior pituitary and related hormones. Lewis MJ, et al. **Br J Clin Pharmacol** 1981 Nov;12(5):737–42

The use of buccal partitioning as a model to examine the effects of aluminium hydroxide gel on the absorption of propranolol. McElnay JC, et al. **Br J Clin Pharmacol** 1982 Mar;13(3):399–403

Effect of propranolol on the airway response to prostaglandin E2 in normal man. Seth RV, et al. **Br J Clin Pharmacol** 1981 Nov; 12(5):731–5

Comparative studies of (−)-, (+/−)-propranolol, atenolol, guanethidine, bretylium and tetracaine on adrenergic transmission. Kaiho M, et al. **Br J Pharmacol** 1981 Oct;74(2):365–70

Diazepam, propranolol and their combination in the management of chronic anxiety. Hallstrom C, et al. **Br J Psychiatry** 1981 Nov; 139:417–21

Propranolol in experimentally induced stress. Taylor EA, et al. **Br J Psychiatry** 1981 Dec;139:545–9

Attenuation of exercise conditioning by beta-adrenergic blockade. Sable DL, et al. **Circulation** 1982 Apr;65(4):679–84

Selective chemical hepatic sympathectomy in the dog. Allman FD, et al. **Crit Care Med** 1982 Feb;10(2):100–3

In vivo study of propranolol and metabolite(s) disposition in rat liver. Ong H, et al. **Drug Metab Dispos** 1981 Nov–Dec;9(6):529–34

Pharmacokinetics of bendroflumethiazide alone and in combination with propranolol and hydralazine. Schäfer-Korting M, et al. **Eur J Clin Pharmacol** 1982;21(4):315–23

Plasma triiodothyronine response to thyrotropin releasing hormone, thyrotropin and propranolol in old age. Szabolcs I, et al. **Exp Gerontol** 1981;16(4):309–16

Effects of isoproterenol on vectorcardiographic pattern of 'early repolarization syndrome'. Fantini F, et al. **G Ital Cardiol** 1981; 11(6):797–802

Glucagon in anaphylaxis [letter] Lee ML. **J Allergy Clin Immunol** 1982 Mar;69(3):331–2

Blood flow and O2 uptake in dog hindlimb with anemia, norepinephrine, and propranolol. Chapler CK, et al. **J Appl Physiol** 1981 Sep; 51(3):565–70

Effect of propranolol on local cerebral blood flow under normocapnic and hypercapnic conditions. Dahlgren N, et al. **J Cereb Blood Flow Metab** 1981;1(4):429–36

Comparative bioavailability of propranolol: twice-daily versus four times-daily administration. Dvornik D, et al. **J Clin Pharmacol** 1981 Nov–Dec;21(11–12 Pt 1):472–6

Is propranolol antischizophrenic? Peet M. **Neuropharmacology** 1981 Dec; 20(12B):1303–7 (36 ref.)

Electrocardiographic and metabolic investigations concerning the exhaustive exercise under conditions of adrenergic blocking in rats. Schneider F, et al. **Physiologie** 1982 Jan–Mar;19(1):31–3

Alpha- and beta-adrenergic control of pancreatic polypeptide and insulin secretion in adult chickens. Smith MK, et al. **Proc Soc Exp Biol Med** 1981 Dec;168(3):319–24

Chemical trapping of labile aldehyde intermediates in the metabolism of propranolol and oxprenolol. Goldszer F, et al. **Res Commun Chem Pathol Pharmacol** 1981 Nov;34(2):193–205

The effect of adrenoceptor blockade on the release of gastric inhibitory polypeptide after intraduodenal glucose in humans. Flaten O. **Scand J Gastroenterol** 1981;16(5):641–5

The effect of propranolol on insulin-stimulated gastric secretion in dogs. Grabner P, et al. **Scand J Gastroenterol** 1981;16(8):1067–72

[Pharmacokinetics of propranolol in healthy humans] Steinhoff J, et al. **Pharmazie** 1981 Nov;36(11):785–6 (Ger)

[Pharmacoprophylaxis of an experimental neurogenic pancreatic injury] Nilova TN. **Farmakol Toksikol** 1982 Jan–Feb;45(1):62–5 (Eng. Abstr.) (Rus)

[Action of propranolol, nifenalol, and pindolol on the lipolytic effect of adrenaline in the rat epididymis] Sánchez-Cuadrado MC, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):181–2 (Spa)

PROSTAGLANDINS

Effect of bisenoic prostaglandins and arachidonic acid on the uterine vasculature of pregnant sheep. Clark KE, et al. **Am J Obstet Gynecol** 1982 Feb 1;142(3):261–8

Effects of renal nerve stimulation, norepinephrine and angiotensin II on renal blood flow in relation to release of PG-like substances in anesthetized dogs. Satoh S, et al. **Arch Int Pharmacodyn Ther** 1981 Dec; 254(2):304–16

Evidence against the involvement of prostaglandins in the vasoconstrictor action of calcium ion in rat mesenteric blood vessels. Coupar IM. **Br J Pharmacol** 1981 Oct;74(2):477–84

Glucocorticoids as inhibitors of prostaglandin synthesis. Russo-Marie F, et al. **Bull Eur Physiopathol Respir** 1981;17(4):587–94 (38 ref.)

Enhancement by prostacyclin of the contractility of the guinea-pig airways smooth muscle. Vargaftig BB, et al. **Eur J Pharmacol** 1981 Sep 11;74(2–3):141–8

Stimulation of prostaglandin synthesis in rat cerebral cortex via a beta-adrenoceptor. Hillier K, et al. **Gen Pharmacol** 1982;13(1):21–5

Evidence for a direct stimulatory effect of prostacyclin on renin release in man. Patrono C, et al. **J Clin Invest** 1982 Jan;69(1):231–9

Central cardiovascular effects of prostacyclin. Feuerstein G, et al. **Neuropharmacology** 1981 Nov;20(11):1085–90

Studies on the behavioral and hypotensive effects of intraventricular prostacyclin (PGI2) in rats. Brus K, et al. **Pol J Pharmacol Pharm** 1981; 33(4):467–74

Effect of corticosterone, hydrocortisone and prostaglandin fatty acid precursors on the spontaneous motility of the uterus isolated from ovariectomized rats. Bonacossa A, et al. **Prostaglandins** 1982 Jan; 23(1):113–28

A proposed role for prostaglandins in the modulation of the relaxation response to urotensin I in isolated rat arteries. Gerritsen ME, et al. **Prostaglandins** 1981 Dec;22(6):873–92

PSYCHIATRY

A program for late twentieth-century psychiatry. Unger RM. **Am J Psychiatry** 1982 Feb;139(2):155–64

[Misunderstanding between neuroscientists and clinicians (author's transl)] Bleuler M. **Nervenarzt** 1982 Jan;53(1):14–7 (Ger)

[The boundary between psychiatry and biological therapeutics] Carrillo Broatch A. **Rev Neuropsiquiatr** 1980 Jun;43(2):87–96 (Eng. Abstr.) (Spa)

[Psychiatry in China. Doubts about Freud, various forms of herbal medicine and Western psychotropic drugs] Calltorp J. **Lakartidningen** 1981 Oct 21;78(43):3788–91 (Eng. Abstr.) (Swe)

PSYCHOLOGY, CLINICAL

[Medical psychology – a tradition-laden area or the expression of a new development in medicine?] Szewczyk H. **Psychiatr Neurol Med Psychol (Leipz)** 1981 Oct;33(10):589–96 (Eng. Abstr.) (Ger)

PSYCHOMOTOR AGITATION

A trial of dextroamphetamine in patients with involutional agitated depression. Ward NG, et al. **J Clin Psychiatry** 1982 Jan;43(1):35–6

PSYCHOPHARMACOLOGY

[Psychoanalysis or pharmacologic blockage in cultivation of mentally handicapped] Baruk H. **Ann Med Psychol (Paris)** 1981;139(3):335–8 (Fre)

[The boundary between psychiatry and biological therapeutics] Carrillo Broatch A. **Rev Neuropsiquiatr** 1980 Jun;43(2):87–96 (Eng. Abstr.) (Spa)

PSYCHOPHYSIOLOGIC DISORDERS

A new model of integrating Occidental and Oriental approaches. Nagakawa T, et al. **J Psychosom Res** 1982;26(1):57–62

Minor tranquilizers: prescribing practices of primary physicians. Rittelmeyer LF Jr. **Psychosomatics** 1982 Jan;23(1):23–6

[Psychotropic drugs in non-psychiatric practice (author's transl)] Reimer F. **HNO** 1981 Dec;29(12):415–7 (Eng. Abstr.) (Ger)

PSYCHOSES, SUBSTANCE-INDUCED

Steroid psychosis and tricyclic antidepressants [letter] Dietch JT. **Arch Gen Psychiatry** 1982 Feb;39(2):236

Lithium withdrawal triggers psychotic states [letter] Klein HE, et al. **Br J Psychiatry** 1981 Sep;139:255–6

Amphetamine psychosis and schizophrenia: a dual model. Kokkinidis L, et al. **Neurosci Biobehav Rev** 1981 Winter;5(4):449–61 (173 ref.)

PSYCHOTHERAPY

Level of ego development and psychotherapy outcome in phobic patients. Rock MH, et al. **Br J Med Psychol** 1981 Dec;54(Pt 4):319–28

The efficacy of cognitive therapy in depression: a treatment trial using cognitive therapy and pharmacotherapy, each alone and in combination. Blackburn IM, et al. **Br J Psychiatry** 1981 Sep;139:181–9

Cognitive therapy for depression [editorial] Goldberg D. **Br Med J [Clin Res]** 1982 Jan 16;284(6310):143–4

Mood, creativity, and psychotherapeutic participation of patients receiving lithium. Phillips RH. **Psychosomatics** 1982 Jan;23(1):81–7

[Depression. Treatment] Hougardy G. **Rev Med Liege** 1982 Jan 1; 37(1):14–6 (Fre)

[Psychotherapy in psychiatric practice (author's transl)] Nedelmann C. **Nervenarzt** 1982 Jan;53(1):33–8 (Ger)

PSYCHOTHERAPY, GROUP

What's a medication group? Larkin AR. **J Psychosoc Nur Ment Health Serv** 1982 Feb;20(2):35–7

[Group psychotherapy of chronic schizophrenics in an external milieu]. Filotto JF. **Can J Psychiatry** 1981 Dec;26(8):558–61 (Eng. Abstr.) (Fre)

PSYCHOTIC DISORDERS

Influence of different psychotropic drugs on psychotic anxiety. Nahunek K, et al. **Agressologie** 1981 Nov;22(D):11-3

Periodic psychosis of puberty: a case report. Berlin FS, et al. **Am J Psychiatry** 1982 Jan;139(1):119-20

Sustaining treatment with the hospitalized patient who refuses treatment. Geller JL. **Am J Psychiatry** 1982 Jan;139(1):112-3

Distribution of lithium elimination rates in a selected population of psychiatric patients. Thornhill DP, et al. **Eur J Clin Pharmacol** 1982; 21(4):351-4

What's a medication group? Larkin AR. **J Psychosoc Nur Ment Health Serv** 1982 Feb;20(2):35-7

Stress, endorphins and psychosis. A hypothesis. Amir S, et al. **Mod Probl Pharmacopsychiatry** 1981;17:192-201

Measurement of endorphins in CSF. Relationship to psychiatric diagnosis. Pickar D, et al. **Mod Probl Pharmacopsychiatry** 1981;17:246-62

Neuroleptic-like and antipsychotic effects of gamma-type endorphins. Van Ree JM, et al. **Mod Probl Pharmacopsychiatry** 1981;17:266-78

Fine motor performance before and after treatment in schizophrenic and schizoaffective patients Goode DJ, et al. **Psychiatry Res** 1981 Dec; 5(3):247-55

Red blood cell/plasma haloperidol ratios and antipsychotic efficacy [letter] Neborsky RJ, et al. **Psychiatry Res** 1982 Feb;6(1):123-4

[Treatment of schizophrenic psychoses by sustained-action neuroleptics in psychiatric outpatients' treatment (author's transl)] Poláček J. **Cesk Psychiatr** 1982 Feb;78(1):49-55 (Eng. Abstr.) **(Cze)**

[Depot Neuroleptic preparations in psychiatric practice (author's transl)] Svestka J, et al. **Cesk Psychiatr** 1981 Jun;77(3):187-97 (Eng. Abstr.) **(Cze)**

[Conditions for prolonged prescription of neuroleptics with reference to several clinical cases] Tholose A. **Ann Med Psychol (Paris)** 1981; 139(8):894-9 **(Fre)**

[Night sleep study in chronic psychotics under long term flupenthixol treatment (author's transl)] Serbanescou T, et al. **Encephale** 1981; 7(5):623-9 (Eng. Abstr.) **(Fre)**

[Comparison between the effectiveness of fluphenazine decanoate and oxyprothepin decanoate in schizophrenia (double-blind crossover study)] Balon R, et al. **Zh Nevropatol Psikhiatr** 1982;82(1):116-8 (Eng. Abstr.) **(Rus)**

QUINIDINE

Hemoperfusion in quinidine intoxication. Haapanen EJ, et al. **Acta Med Scand** 1981;210(6):515-6

Digoxin--quinidine interaction [letter] Das G. **Am J Cardiol** 1982 Feb 1;49(2):495

Pharmacokinetic analysis of intravenously and orally administered quinidine in cows. McGuirk SM, et al. **Am J Vet Res** 1981 Sep; 42(9):1482-7

Shortening of the action potential and reduction of pacemaker activity by lidocaine, quinidine, and procainamide in sheep cardiac purkinje fibers. An effect on Na or K currents? Carmeliet E, et al. **Circ Res** 1982 Feb;50(2):257-72

Mechanisms of action of lidocaine and quinidine on action potential duration in rabbit cardiac Purkinje fibers. An effect on steady state sodium currents? Colatsky TJ. **Circ Res** 1982 Jan;50(1):17-27

Mechanisms of quinidine-induced depression of maximum upstroke velocity in ovine cardiac Purkinje fibers. Weld FM, et al. **Circ Res** 1982 Mar;50(3):369-76

Age-related differences in the protein binding of quinidine. Pickoff AS, et al. **Dev Pharmacol Ther** 1981;3(2):108-15

Absorption of quinidine and dihydroquinidine in humans. Hailey DM, et al. **Eur J Clin Pharmacol** 1981;21(3):195-9

Digoxin - quinidine interaction [letter] Cheng TO. **J Am Geriatr Soc** 1982 Jan;30(1):79-80

Influence of disopyramide, compared with procainamide and quinidine, on isolated dog arteries in response to transmural stimulation and norepinephrine. Toda N, et al. **J Cardiovasc Pharmacol** 1981 Nov-Dec; 3(6):1332-41

Investigation of digoxin, quinidine, and disopyramide interactions in rats utilizing parotid saliva, blood, and other tissues. DiGregorio GJ, et al. **J Pharm Sci** 1982 Feb;71(2):211-3

Enzyme immunoassay and two fluorometric methods compared for the determination of quinidine in serum. Pape BE. **Ther Drug Monit** 1981; 3(4):357-63

REACTION TIME

Acute behavioral effects of styrene exposure: a further analysis. Cherry N, et al. **Br J Ind Med** 1981 Nov;38(4):346-50

RECEPTORS, ADRENERGIC

Receptor supersensitivity in mental disease. Westermann KH, et al. **Agressologie** 1981 Nov;22(E):33-5

Studies on the mechanism of action of somatostatin on renal gluconeogenesis: evidence for the involvement of alpha 1-adrenergic stimuli. Dileepan KN, et al. **Arch Biochem Biophys** 1982 Jan; 213(1):169-76

Adrenergic receptor sensitivity in depression. Effects of clonidine in depressed patients and healthy subjects. Charney DS, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):290-4

Catecholamine binding to the alpha-adrenergic receptors of hamster adipocytes. Evidence that guanine nucleotides regulate this binding to the alpha 2-receptor subtype. Pecquery R, et al. **Biochim Biophys Acta** 1982 Jan 12;714(1):14-25

Inhibitory action of the ventral noradrenergic bundle on the lateral hypothalamic neurons through alpha-noradrenergic mechanisms in the rat. Miyahara S, et al. **Brain Res** 1982 Feb 25;234(2):459-63

The regulation of striatal DOPA synthesis by alpha 2-adrenoreceptors. Rabey JM, et al. **Brain Res** 1981 Dec 28;230(1-2):422-6

Guanine nucleotide and magnesium ion regulation of the interaction of gonadotropic and beta-adrenergic receptors with their hormones: a comparative study using a single membrane system. Abramowitz J, et al. **Endocrinology** 1982 Feb;110(2):336-46

Differential effects of pharmacological manipulations of central alpha 1- and alpha 2-adrenergic receptors on the secretion of thyrotropin and growth hormone in male rats. Krulich L, et al. **Endocrinology** 1982 Mar;110(3):796-804

Involvement of alpha 1-adrenergic receptors in the inhibitory effect of catecholamines on the thyrotropin-induced release of thyroxine by the mouse thyroid. Muraki T, et al. **Endocrinology** 1982 Jan;110(1):51-4

Evidence for involvement of alpha-adrenergic receptors in norepinephrine-induced prostaglandin E2 and luteinizing hormone-releasing hormone release from the median eminence. Ojeda SR, et al. **Endocrinology** 1982 Feb;110(2):409-12

Adrenergic mechanisms involved in the control of pituitary-adrenal activity in the rat: a beta-adrenergic stimulatory mechanism. Tilders FJ, et al. **Endocrinology** 1982 Jan;110(1):114-20

Cation sensitivity of [125I]heat binding to alpha 1-adrenoceptors in rat cerebral cortex membranes. Glossmann H, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):149-53

Discrepancy in the regulatory effects of sodium and guanine nucleotides on adrenaline and clonidine binding to alpha 2-adrenoceptors in human fat cell membranes. Gonzalez JL, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):289-93

The increase of cardiac beta 1-subtype of beta-adrenergic receptors in adult rats following neonatal 6-hydroxydopa treatment. Kajiyama H, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):75-7

alpha 1-Adrenoceptor-mediated responses in the lateral geniculate nucleus are enhanced by chronic antidepressant treatment. Menkes DB, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):27-35

Influence of age on the effects of chronic fluphenazine on receptor binding in rat brain. Misra CH, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):317-24

Adrenal steroid-induced changes in beta-adrenergic receptor binding in rat hippocampus. Roberts DC, et al. **Eur J Pharmacol** 1981 Aug 27; 74(1):37-41

Haemophilus influenzae induced loss of lung beta-adrenoceptor binding sites and modulation by changes in peripheral catecholaminergic input. Schreurs AJ, et al. **Eur J Pharmacol** 1982 Jan;77(2-3):95-102

Effect of norepinephrine uptake blocker on beta-adrenergic receptors of the rat cerebral cortex. Sethy VH, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):53-6

Reserpine-induced supersensitivity and the proliferation of cardiac beta-adrenoceptors. Tenner TE Jr, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):61-5

Agonistic actions of DPI (2-(3,4-dihydroxyphenylimino)-imidazolidine) on alpha-adrenoceptors and dopamine receptors. Woodman OL, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):11-9

Desensitization of the beta-adrenergic receptor-adenylate cyclase complex in rabbit iris-ciliary body induced by topical epinephrine. Mittag T, et al. **Exp Eye Res** 1981 Nov;33(5):497-503

Stimulation of prostaglandin synthesis in rat cerebral cortex via a beta-adrenoceptor. Hillier K, et al. **Gen Pharmacol** 1982;13(1):21-5

Synthesis and adrenoceptor affinity of some highly polar beta-substituted catecholamines. Henkel JG, et al. **J Med Chem** 1981 Oct; 24(10):1258-60

(alpha S)-erythro-alpha-methylepinephrine: preparation and stereoselective binding to adrenergic receptors in rat forebrain. Taylor CA Jr, et al. **J Med Chem** 1981 Oct;24(10):1261-3

Enhanced responsiveness of alpha-noradrenergic receptors following discrete electrolytic lesions of the nucleus locus coeruleus: a behavioral demonstration. De Carvalho LP, et al. **J Neural Transm** 1982; 53(1):23-37

Electroconvulsive shock and reserpine: effects on beta-adrenergic receptors in rat brain. Kellar KJ, et al. **J Neurochem** 1981 Oct; 37(4):830-6

Modulation of central noradrenaline release by postsynaptic receptors. Wyllie MG, et al. **J Pharm Pharmacol** 1982 Jan;34(1):53-5

Calcium and the alpha-action of catecholamines on guinea-pig taenia caeci. Den Hertog A. **J Physiol (Lond)** 1981 Jul;316:109-25

Alpha 2 adrenergic receptors in depression [editorial] **Lancet** 1982 Apr 3;1(8275):781

Development of stimulus-secretion coupling in salivary glands. Cutler LS, et al. **Methods Cell Biol** 1981;23:531–45

Antagonistic properties of quipazine at presynaptic serotonin receptors and alpha-adrenoceptors in rat brain cortex slices. Schlicker E, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):204–8

3H-Noradrenaline and 3H-5-hydroxytryptamine release from rat brain slices and its presynaptic alpha-adrenergic modulation after long-term desipramine pretreatment. Schoffelmeer AN, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):173–80

Beta-adrenergic receptors in rat cerebellum after neonatal X-irradiation: effect of prolonged imipramine and lithium treatment. Türck M, et al. **Neurosci Lett** 1981 Dec 23;27(3):357–62

Characterization of catecholamine binding sites in the rat brain. Agrawal AK, et al. **Neurotoxicology (Park Forest II)** 1981 Oct;2(2):365–71

Brain reinforcement mechanisms: alpha-adrenergic and dopaminergic agonists and antagonists. Wauquier A, et al. **Prog Clin Biol Res** 1981; 71:177–96

Subsensitivity of human beta-adrenergic adenylate cyclase after salbutamol treatment of depression. Lerer B, et al. **Psychopharmacology (Berlin)** 1981;75(2):169–72

[Role of postsynaptic noradrenergic receptors in the mechanism of action of antidepressants] Cuenca E. **Encephale** 1981;7(4 Suppl):397 (Fre)

RECEPTORS, CHOLINERGIC

Increase of acetylcholine-receptor sensitivity by adenosine triphosphate: a novel action of ATP on ACh-sensitivity. Akasu T, et al. **Br J Pharmacol** 1981 Oct;74(2):505–7

Muscarinic acetylcholine receptors of the small intestine and pancreas of the rat: distribution and the effect of vagotomy. Isaacs PE, et al. **Clin Sci** 1982 Feb;62(2):203–7

Autoregulation of acetylcholine release in isolated hippocampal nerve endings. Marchi M, et al. **Eur J Pharmacol** 1981 Jul 17;73(1):75–9

Influence of age on the effects of chronic fluphenazine on receptor binding in rat brain. Misra CH, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):317–24

Phenylclindine-induced alteration in rat muscarinic cholinergic receptor regulation. Ward D, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2–3):189–93

Relation between subsynaptic receptor blockade and response to quantal transmitter at the mouse neuromuscular junction. Pennefather P, et al. **J Gen Physiol** 1981 Sep;78(3):313–44

Adenylate cyclase of Torpedo synaptosomes is inhibited by calcium and not affected by muscarinic ligands. Pinchasi I, et al. **J Neurochem** 1982 May;38(5):1223–9

The kinetics of acetylcholine turnover in a resting cholinergic nerve terminal and the magnitude of the cytoplasmic compartment. Weiler M, et al. **J Neurochem** 1982 May;38(5):1187–91

Loss of muscarinic receptors and of stimulated phospholipid labeling in ibotenate-treated hippocampus. Fisher SK, et al. **J Neurosci** 1981 Dec; 1(12):1407–13

A study of desensitization of acetylcholine receptors using nerve-released transmitter in the frog. Magleby KL, et al. **J Physiol (Lond)** 1981 Jul; 316:225–50

Interaction of tricyclic antidepressants with the ionic channel of the acetylcholine receptor of Torpedo electric organ. Shaker N, et al. **Mol Pharmacol** 1981 Nov;20(3):511–8

Sympathetic Nerve Stimulation on the perfused rat heart. Affinities of N-methylatropine and pirenzepine at pre- and postsynaptic muscarine receptors. Fuder H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):210–9

Decreased 3H-L-quinuclidinyl benzilate binding and muscarine receptor subsensitivity after chronic gamma-butyrolactone treatment. Giorgi O, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Dec;318(1):14–8

Cholinergic actions of false neurotransmitters: acetyldiethylcholine. Aronstam RS, et al **Neurosci Lett** 1982 Jan 22;28(1):51–6

Changes in rat hippocampal benzodiazepine receptors and lack of changes in muscarinic receptors after fimbria-fornix lesions. Sábato UC, et al. **Neurosci Lett** 1981 Dec 11;27(2):193–7

Changes in neuromuscular junction endplate current time constants produced by sulfhydryl reagents. Steinacker A, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7806–9

3-Chlorodibenzazepine binding to cholinergic receptors and ion channels. Aronstam RS, et al. **Res Commun Chem Pathol Pharmacol** 1981 Dec; 34(3):551–4

[The blocking potencies and the mode of blockade by pentobarbital and phenobarbital, examined on various types of ACh-receptor activities (author's transl)] Somei K. **Nippon Seirigaku Zasshi** 1981; 43(11):529–31 (Eng. Abstr.) (Jpn)

[Psychological component of human stress (author's transl)] Vargas Fernández L. **Rev Med Chil** 1981 May;109(5):441–51 (Eng. Abstr.) (Spa)

RECEPTORS, DOPAMINE

Intestinal pharmacomanometry and glucose tolerance: two kinds of dopaminergic mechanisms in the human. Lechin F, et al. **Acta Gastroenterol Latinoam** 1981;11(2):247–59 (116 ref.)

An attempt to use central dopaminergic stimulation as a reinforcement for T-maze learning in rats. Jurkowlaniec E, et al. **Acta Neurobiol Exp (Warsz)** 1981;41(4):357–62

Receptor supersensitivity in mental disease. Westermann KH, et al. **Agressologie** 1981 Nov;22(E):33–5

Prejunctional inhibitory dopamine receptors in the rat isolated vas deferens. Tayo FM. **Arch Int Pharmacodyn Ther** 1981 Nov; 254(1):28–37

Subsensitivity of the presynaptic dopamine receptors in cat heart after the termination of chronic haloperidol treatment. Verimer T, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):233–40

Irreversible blockade of [3H]spiperone- but not [3H]dopamine-labeled dopamine receptors with phenoxybenzamine. Titeler M. **Biochem Pharmacol** 1981 Nov 15;30(22):3031–7

N-n-propyl-norapomorphine: an extremely potent stimulant of dopamine autoreceptors. Argiolas A, et al. **Brain Res** 1982 Jan 7;231(1):109–16

Evidence for dopamine autoreceptors controlling dopamine synthesis in the substantia nigra. Argiolas A, et al. **Brain Res** 1982 Feb 18; 234(1):177–81

ACTH 1–24 and lysine vasopressin selectively activate dopamine synthesis in frontal cortex. Delanoy RL, et al. **Brain Res** 1982 Jan 7; 231(1):117–29

Characterization of high affinity dopamine uptake into the dopamine neurons of the hypothalamus. George SR, et al. **Brain Res** 1982 Feb 25;234(2):339–55

Neurotensin effects on brain dopaminergic systems. Haubrich DR, et al. **Brain Res** 1982 Jan 7;231(1):216–21

Effects of acute and chronic administration of phencyclidine on dopaminergic receptors in rat striatum. Leelavathi DE, et al. **Commun Psychopharmacol** 1980;4(5):417–24

The role of dopaminergic and serotonergic mechanisms in the development of swimming ability of young rats. Tamásy V, et al. **Dev Neurosci** 1981;4(5):389–400

Guanine nucleotides regulate both dopaminergic agonist and antagonist binding in porcine anterior pituitary. De Lean A, et al. **Endocrinology** 1982 Mar;110(3):1064–6

Dopaminergic inhibition of pituitary beta-endorphin-like immunoreactivity secretion in the rat. Farah JM Jr, et al. **Endocrinology** 1982 Feb;110(2):657–9

An orally effective, long-acting dopaminergic prodrug: (-)-10,11-methylenedioxy-N-propylnoraporphine. Baldessarini RJ, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):87–8

Hypophysectomy does not prevent development of striatal dopamine receptor supersensitivity induced by repeated neuroleptic treatment. Jenner P, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):31–6

Phenoxybenzamine blocks dopamine autoreceptors irreversible: implications for multiple dopamine receptor hypotheses. Lehmann J, et al. **Eur J Pharmacol** 1981 Nov 5;75(4):247–54

Pharmacological profiles of the putative dopamine autoreceptor agonists 3-PPP and TL-99. Martin GE, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):15–23

Irreversible blockade of striatal dopamine receptors in vivo by a derivative of alpha-flupenthixol. Schuster DI, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):313–6

Behavioural evidence for supersensitivity of postsynaptic dopamine receptors in the mesolimbic system after chronic administration of desipramine. Spyraki C, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2–3):195–206

Stereospecific long-term effects of amphetamine on striatal dopamine neurons in rats. Steranka LR. **Eur J Pharmacol** 1981 Dec 17; 76(4):443–6

Agonistic actions of DPI (2-(3,4-dihydroxyphenylimino)-imidazolidine) on alpha-adrenoceptors and dopamine receptors. Woodman OL, et al. **Eur J Pharmacol** 1981 Oct 15;75(1):11–9

Effect of metoclopramide in guinea-pig ileum longitudinal muscle: evidence against dopamine-mediation. Zar MA, et al. **Gut** 1982 Jan; 23(1):66–70

Future directions in dopaminergic nervous system and dopaminergic agonists. Cannon JG, et al. **J Med Chem** 1981 Oct;24(10):1113–8 (66 ref.)

Stereospecific blockade of alpha 2-adrenoceptors by (+)-butaclamol: implications for the characterization of dopamine receptors. Spedding M, et al. **J Pharm Pharmacol** 1982 Jan;34(1):56–8

The vascular dopamine receptor : a review. Schmidt M, et al. **J Pharmacol** 1981 Nov-Dec;12(4):355–82 (183 ref.)

Acute changes in the state of dopamine receptors; in vitro monitoring with 3H-dopamine. Bacopoulos NG. **Life Sci** 1981 Dec 7; 29(23):2407–14

Evidence for a coupling between dopaminergic receptors and phospholipid methylation in mouse B lymphocytes. Le Fur G, et al. **Life Sci** 1981 Dec 28;29(26):2737–49

Solubilization and characterization of 3H-spiroperidol binding sites of calf caudate. Lerner MH, et al. **Life Sci** 1981 Dec 7;29(23):2367-74

An hypothesis of the molecular structure of the dopamine receptor. Smythies JR. **Med Hypotheses** 1981 Dec;7(12):1449-56

Unique response to antipsychotic drugs is due to absence of terminal autoreceptors in mesocortical dopamine neurones. Bannon MJ, et al. **Nature** 1982 Apr 1;296(5856):444-6

Analysis of the effects of dopamine and noradrenaline in relation to the proposed postsynaptic dopamine receptor in rat vas deferens. Langeloh A, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb; 318(3):202-9

Neuroleptic malignant syndrome caused by dopamine depleting drugs [letter] Login IS, et al. **Neurology (NY)** 1982 Feb;32(2):218-9

Differential involvement of dopamine-containing tracts in 5-hydroxytryptamine-dependent behaviours caused by amphetamine in large doses. Andrews CD, et al. **Neuropharmacology** 1982 Jan; 21(1):63-8

Site-specific blockade of dopamine receptors by neuroleptic agents in human brain. Borison RL, et al. **Neuropharmacology** 1981 Dec; 20(12B):1321-2

Are striatal [3H]spiperone radioreceptor assays indicative of multiple dopamine receptor interactions? Clements-Jewery S, et al. **Neuropharmacology** 1981 Dec;20(12B):1295-8

Chronic electroconvulsive shock and chronic haloperidol administration are not additive in effects on dopamine receptors. Globus M, et al. **Neuropharmacology** 1981 Nov;20(11):1125-8

Studies on the action of (+/-)sulpiride on dopamine receptors in the rat brain in vivo. Hasan F, et al. **Neuropharmacology** 1981 Dec; 20(12B):1327-30

Cocaine-induced supersensitivity of striatal dopamine receptors: role of endogenous calmodulin. Memo M, et al. **Neuropharmacology** 1981 Dec; 20(12A):1145-50

Possible mixed agonist—antagonist activity of D-sulpiride at dopamine receptor level in man. Benfenati F, et al. **Neurosci Lett** 1981 Nov 4; 26(3):289-95

Failure to obtain functional equivalence between dopamine receptor blockade and extinction: evidence supporting a sensory-motor conditioning hypothesis. Tombaugh TN, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):67-72

Isolated horizontal cells from carp retina demonstrate dopamine-dependent accumulation of cyclic AMP. Van Buskirk R, et al. **Proc Natl Acad Sci USA** 1981 Dec;78(12):7825-9

Brain reinforcement mechanisms: alpha-adrenergic and dopaminergic agonists and antagonists. Wauquier A, et al. **Prog Clin Biol Res** 1981; 71:177-96

Phenothiazine biphasic effect on dopamine concentrations in the basal ganglia of subhuman primates. Bird ED, et al. **Psychiatry Res** 1982 Feb;6(1):1-6

The role of dopaminergic mechanisms in the rat hippocampus for the consolidation in a brightness discrimination. Grecksch G, et al. **Psychopharmacology (Berlin)** 1981;75(2):165-8

Flupentixol and dopamine receptor selectivity [letter] Hyttel J. **Psychopharmacology (Berlin)** 1981;75(2):217

Assessing pharmacologically induced dopamine receptor sensitivity changes with the Ungerstedt turning model. Siever L, et al. **Psychopharmacology (Berlin)** 1981;75(2):212-3

Binding of antiparkinsonian ergot derivatives to the dopamine receptor. Weir RL, et al. **Psychopharmacology (Berlin)** 1981;75(2):119-23

Differential inhibitory effects of ascorbic acid on the binding of dopamine agonists and antagonists to neostriatal membrane preparations: correlations with behavioral effects. Heikkila RE, et al. **Res Commun Chem Pathol Pharmacol** 1981 Dec;34(3):409-21

[Effect of chronic administration of lithium chloride on the development of dopamine receptor sensitivity during morphine withdrawal in rats] Allikmets LKh, et al. **Biull Eksp Biol Med** 1981 Nov;92(11):571-2 (Eng. Abstr.) **(Rus)**

[Ligand-dopaminergic receptor bond in the guinea pig bladder] Idoipe Tomás C, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):123-4 **(Spa)**

RECEPTORS, DRUG

Localization of the site of the anticonflict action of benzodiazepines in the amygdaloid nucleus of rats. Shibata K, et al. **Brain Res** 1982 Feb 25;234(2):442-6

Ontogeny of 3H-diazepam binding sites in different rat brain area. Effect of GABA. Aldinio C, et al. **Dev Neurosci** 1981;4(6):461-6

The effect of GTP on benzodiazepine receptors. Fong JC, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):57-9

In situ molecular weight determination of brain and peripheral benzodiazepine binding sites. Paul SM, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):465-6

Stereospecific displacement of [3H]phencyclidine (PCP) receptor binding by an enantiomeric pair of PCP analogs. Quirion R, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):107-8

Interactions of beta-carbolines with the benzodiazepine receptor: structure-activity relationships. Robertson HA, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):281-4

3H-Diazepam binding sites in Roman high- and low-avoidance rats. Gentsch C, et al. **Experientia** 1981 Dec 15;37(12):1315-6

gamma-Aminobutyric acid- and benzodiazepine-binding sites in human anterior pituitary tissue. Grandison L, et al. **J Clin Endocrinol Metab** 1982 Mar;54(3):597-601

Identification of synapse specific components: synaptic glycoproteins, proteins, and transmitter binding sites. Mena EE, et al. **J Neurochem** 1981 Dec;37(6):1557-66

Molecular interactions of etazolate with benzodiazepine and picrotoxinin binding sites. Ticku MK, et al. **J Neurochem** 1982 Apr;38(4):1180-2

Effects of putative endogenous benzodiazepine receptor ligands on the potentiation of adenosine by benzodiazepines in isolated smooth muscle. Slater P, et al. **J Pharm Pharmacol** 1982 Jan;34(1):42-4

Comparison of the effects of GABA and chloride ion on the affinities of ligands for the benzodiazepine receptor. Fujimoto M, et al. **Life Sci** 1982 Jan 4;30(1):51-7

Halide- and gamma-aminobutyric acid-induced enhancement of diazepam receptors in rat brain. Reversal by disulfonic stilbene blockers of anion channels. Costa T, et al. **Mol Pharmacol** 1981 Nov;20(3):470-6

gamma-Aminobutyric acid enhancement of CL 218,872 affinity and evidence of benzodiazepine receptor heterogeneity. Regan JW, et al. **Mol Pharmacol** 1981 Nov;20(3):477-83

Benzodizepines: biochemistry of function. Tallman JF. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(33):4-11

Molecular size of benzodiazepine receptor in rat brain in situ: evidence for a functional dimer? Doble A, et al. **Nature** 1982 Feb 11; 295(5849):522-3

Agonist and antagonist benzodiazepine receptor interaction in vitro. Möhler H, et al. **Nature** 1981 Dec 24;294(5843):763-5

Functional interaction between benzodiazepine and GABA recognition sites in aged rats. Calderini G, et al. **Neurobiol Aging** 1981 Winter; 2(4):309-13

Chronic clonazepam administration induces benzodiazepine receptor subsensitivity. Crawley JN, et al. **Neuropharmacology** 1982 Jan; 21(1):85-9

[3H]Sulpiride, a ligand for neuroleptic receptors. Freedman SB, et al. **Neuropharmacology** 1981 Dec;20(12B):1323-6

6 -Hydroxydopamine decreases benzodiazepine but not GABA receptor binding in rat cerebellum. Doble A, et al. **Neurosci Lett** 1981 Dec 11; 27(2):199-204

Desensitization-like changes in GABA receptor binding of rat fascia dentata after entorhinal lesion. Nadler JV. **Neurosci Lett** 1981 Nov 4; 26(3):275-81

Changes in rat hippocampal benzodiazepine receptors and lack of changes in muscarinic receptors after fimbria-fornix lesions. Sábato UC, et al. **Neurosci Lett** 1981 Dec 11;27(2):193-7

The effects of acute administration of diazepam on the binding of [3H]-diazepam and [3H]-gaba to rat cortical membranes. Coupet J, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):965-8

Human platelet imipramine recognition sites: biochemical and pharmacological characterization. Wennogle LP, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):975-82

[Value of the binding site for tritiated imipramine in the pharmacology of antidepressants] Zarifian E. **Encephale** 1981;7(4 Suppl):405-7 **(Fre)**

[Molecular mechanisms of the pharmacologic action of benzodiazepines] Korneev AIa, et al. **Vestn Akad Med Nauk SSSR** 1982;(1):20-8 (Eng. Abstr.) **(Rus)**

[Physicochemical heterogeneity of the GABA receptors and the detection of the differences in their structural relation with benzodiazepine receptors] Korneev AIa, et al. **Zh Nevropatol Psikhiatr** 1981; 81(11):1661-2 (Eng. Abstr.) **(Rus)**

RECEPTORS, ENDORPHIN

Endorphins and behavior. Bolles RC, et al. **Annu Rev Psychol** 1982; 33:87-101

Neostriatal enkephalin-immunoreactive neurones project to the globus pallidus. Del Fiacco M, et al. **Brain Res** 1982 Jan 7;231(1):1-17

Effect of dorsal rhizotomy on the autoradiographic distribution of opiate and neurotensin receptors and neurotensin-like immunoreactivity within the rat spinal cord. Ninkovic M, et al. **Brain Res** 1981 Dec 28; 230(1-2):111-9

Interaction of p-nitrophenylalanine enkephalins with mu-, delta- and kappa-subtypes of the opiate receptor. Fauchère JL, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):339-42

Opiate receptor-binding activity of [D-Thr2,Thz5]-and [D-Met2,Thz5]-enkephalinamides. Ferrara P, et al. **Eur J Pharmacol** 1981 Jul 17;73(1):69-73

Excitability ot beta-endorphin, morphine and catecholamines of the vas deferens of the rat at different stages of development. Huidobro-Toro JP, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):115-8

Mixed type inhibition of [D-Ala2, D-Leu5]enkephalin binding to mu-opiate binding sites by mu-, but not by kappa-opiate ligands. Pfeiffer A, et al. **Eur J Pharmacol** 1982 Feb 5;77(4):359-61

Dynorphins: similar relative potencies on mu, delta- and kappa-opiate receptors. Quirion R, et al. **Eur J Pharmacol** 1981 Dec 17; 76(4):467-8

Psychotomimetic opioid binding: specific binding of [3H]SKF-10047 to etorphine-inaccessible sites in guinea-pig brain. Su TP. **Eur J Pharmacol** 1981 Oct 15;75(1):81-2

Comparative immunocytochemical localization of putative opioid ligands in the central nervous system. Stengaard-Pedersen K, et al. **Histochemistry** 1981;73(1):89-114 (50 ref.)

beta-Endorphin and deletion peptides. A correlation of opiate receptor affinity with helix potential. Hammonds RG Jr, et al. **J Biol Chem** 1982 Mar 25;257(6):2990-5

Stress and endogenous opioid peptides: a review. Millan MJ. **Med Probl Pharmacopsychiatry** 1981;17:49-67

Localization and modulation of enkephalins, endorphins and opiate receptors in the CNS and the pituitary gland. Simantov R. **Med Probl Pharmacopsychiatry** 1981;17:38-48

Endorphins, opiate receptors and their evolving biology. Smith JR, et al. **Pathobiol Annu** 1981;11:87-126 (212 ref.)

The correlation between swim-stress induced antinociception and [3H] leu-enkephalin binding to brain homogenates in mice. Christie MJ, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):853-7

Method of sacrifice influences leucine enkephalin binding to mouse brain. Christie MJ, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):849-51

RECEPTORS, HORMONE

Studies on the mechanism of the GABAergic inhibition of TSH secretion in male rats. Mattila J. **Acta Pharmacol Toxicol (Copenh)** 1981 Apr; 48(4):320-5

Interaction of tryptophan-modified analogues of cholecystokinin-octapeptide with cholecystokinin receptors on pancreatic acini. Adachi H, et al. **Biochim Biophys Acta** 1981 Dec 18; 678(3):358-63

Changes in prolactin binding sites in the rabbit hypothalamus induced by physiological and pharmacological variations of prolactin serum levels. Di Carlo R, et al. **Brain Res** 1981 Dec 28;230(1-2):445-50

Evidence for GABA receptors on serotonergic afferent terminals in the substantia nigra and on nigral efferent projections to the caudal mesencephalon. Gale K. **Brain Res** 1982 Jan 7;231(1):209-15

Effect of dorsal rhizotomy on the autoradiographic distribution of opiate and neurotensin receptors and neurotensin-like immunoreactivity within the rat spinal cord. Ninkovic M, et al. **Brain Res** 1981 Dec 28; 230(1-2):111-9

Guanine nucleotide and magnesium ion regulation of the interaction of gonadotropic and beta-adrenergic receptors with their hormones: a comparative study using a single membrane system. Abramowitz J, et al. **Endocrinology** 1982 Feb;110(2):336-46

The postnatal development of the pituitary thyrotropin-releasing hormone receptor in male and female rats. Banerji A, et al. **Endocrinology** 1982 Feb;110(2):663-4

Induction of testicular gonadotropin-releasing hormone (GnRH) receptors by GnRH: effects of pituitary hormones and relationship to inhibition of testosterone production. Bourne GA, et al. **Endocrinology** 1982 Mar;110(3):727-33

Hypothalamic regulation of pituitary gonadotropin-releasing hormone receptors: effects of hypothalamic lesions and a gonadotropin-releasing hormone antagonist. Clayton RN, et al. **Endocrinology** 1982 Apr; 110(4):1108-15

Hypothalamic regulation of pituitary gonadotropin-releasing hormone receptors: effects of gonadotropin-releasing hormone immunoneutralization. Clayton RN, et al. **Endocrinology** 1982 Apr; 110(4):1116-22

Pituitary receptor sites for gonadotropin-releasing hormone: effect of castration and substitutive therapy with sex steroids in the male rat. Conne BS, et al. **Endocrinology** 1982 Jan;110(1):70-9

Dependence of pituitary gonadotropin-releasing hormone (GnRH) receptors on GnRH secretion from the hypothalamus. Pieper DR, et al. **Endocrinology** 1982 Mar;110(3):749-53

Affinity of thiocolchicoside and thiocolchicoside analogues for the postsynaptic GABA receptor site. Biziere K, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):167-8

Endogenous GABA determines the characteristics of [3H]GABA-binding. Gardner CR, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):83-92

ACTH1-24 increases stimulation-evoked noradrenaline release from sympathetic nerves by acting on presynaptic ACTH receptors. Göthert M. **Eur J Pharmacol** 1981 Dec 3;76(2-3):295-6

Effect of Nin-formylation of the tryptophan residue on gastrin (HG-13) binding and on gastric acid secretion. Magous R, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):11-6

Pituitary somatostatin receptors. Characterization by binding with a nondegradable peptide analogue. Aguilera G, et al. **J Biol Chem** 1982 Feb 10;257(3):1134-7

gamma-Aminobutyric acid- and benzodiazepine-binding sites in human anterior pituitary tissue. Grandison L, et al. **J Clin Endocrinol Metab** 1982 Mar;54(3):597-601

Inhibition of [3H]GABA binding to postsynaptic receptors in human cerebellar synaptic membranes by carboxyl and amino derivatives of GABA. Breckenridge RJ, et al. **J Neurochem** 1981 Oct;37(4):837-44

The binding of the GABA agonist [3H]THIP to rat brain synaptic membranes. Falch E, et al. **J Neurochem** 1982 Apr;38(4):1123-9

Effect of homo-beta-proline and other heterocyclic GABA analogues on GABA uptake in neurons and astroglial cells and on GABA receptor binding. Larsson OM, et al. **J Neurochem** 1981 Dec;37(6):1509-16

gamma-Aminobutyric acid (GABA) receptor stimulation. II. Specificity of progabide (SL 76002) and SL 75102 for the GABA receptor. Lloyd KG, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):672-7

Functional interaction between benzodiazepine and GABA recognition sites in aged rats. Calderini G, et al. **Neurobiol Aging** 1981 Winter; 2(4):309-13

6 -Hydroxydopamine decreases benzodiazepine but not GABA receptor binding in rat cerebellum. Doble A, et al. **Neurosci Lett** 1981 Dec 11; 27(2):199-204

The effects of acute administration of diazepam on the binding of [3H]-diazepam and [3H]-gaba to rat cortical membranes. Coupet J, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):965-8

Regulation of gonadotropin secretion in the anterior pituitary. Hopkins CR, et al. **Philos Trans R Soc Lond [Biol]** 1981 Dec 18; 296(1080):73-81

[Mianserin, presynaptic receptor and biochemical model of depression of Tissot (author's transl)] Dereux JF. **Encephale** 1981; 7(4 Suppl):399-400 (Eng. Abstr.) **(Fre)**

[Molecular mechanisms of the pharmacologic action of benzodiazepines] Korneev AIa, et al. **Vestn Akad Med Nauk SSSR** 1982;(1):20-8 (Eng. Abstr.) **(Rus)**

RECEPTORS, SEROTONIN

On the interaction of histamine with the tryptaminergic smooth-muscle receptors. Todorov S, et al. **Acta Physiol Pharmacol Bulg** 1980; 6(4):47-54

Receptor supersensitivity in mental disease. Westermann KH, et al. **Agressologie** 1981 Nov;22(E):33-5

5-HT receptors and hyper- or hypothermia: elucidation by catecholamine antagonists injected into the cat hypothalamus. Ruwe WD, et al. **Brain Res Bull** 1982 Jan;8(1):79-86

The role of dopaminergic and serotonergic mechanisms in the development of swimming ability of young rats. Tamásy V, et al. **Dev Neurosci** 1981;4(5):389-400

Substance P, but not TRH, modulates the 5-HT autoreceptor in ventral lumbar spinal cord. Mitchell R, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):119-20

Enhancement of responsiveness of the central serotonergic system and serotonin-2 receptor density in rat frontal cortex by electroconvulsive treatment. Vetulani J, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):81-5

Modulation by estradiol of serotonin receptors in brain. Biegon A, et al. **J Neurosci** 1982 Feb;2(2):199-205

Possible hazards in serotonin binding assays in human and rat brain: effects of ascorbate, pargyline, and buffer concentration. Weiner N, et al. **J Neurosci Methods** 1982 Jan;5(1-2):41-5

Antagonistic properties of quipazine at presynaptic serotonin receptors and alpha-adrenoceptors in rat brain cortex slices. Schlicker E, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):204-8

Sleep suppressant action of quipazine: relation to central serotonergic stimulation. Fornal C, et al. **Pharmacol Biochem Behav** 1981 Dec; 15(6):937-44

REFLEX

Central and peripheral adrenergic modulation of carotid sinus-induced renin release. Schultz HD, et al. **Am J Physiol** 1982 Mar; 242(3):R318-25

Reflex sympathetic augmentation of left-ventricular inotropic state in the conscious dog. Yoran C, et al. **Am J Physiol** 1981 Dec; 241(6):H857-63

Feather position of the pigeon after intrahypothalamic injections of noradrenaline, 5-hydroxytryptamine and carbachol. Rintamäki H, et al. **Experientia** 1981 Nov 15;37(11):1173-5

[Effect of phentolamine on carotid reflexes induced by acetylcholine] Silva Carvalho L, et al. **C R Soc Biol (Paris)** 1981;175(6):913-5 (Eng. Abstr.) **(Fre)**

[Comparative characteristics of the reactions of small intestine vessels to neurogenic influences and catecholamine application] Polenov SA, et al. **Fiziol Zh SSSR** 1981 Dec;67(12):1845-52 (Eng. Abstr.) **(Rus)**

REINFORCEMENT (PSYCHOLOGY)

An attempt to use central dopaminergic stimulation as a reinforcement for T-maze learning in rats. Jurkowlaniec E, et al. **Acta Neurobiol Exp (Warsz)** 1981;41(4):357-62

The effect of intrahypothalamic serotonin reinforcement on directional preference in rats. Lesiecka M, et al. **Acta Neurobiol Exp (Warsz)** 1981; 41(5):439-46

Brain reinforcement mechanisms: alpha-adrenergic and dopaminergic agonists and antagonists. Wauquier A, et al. **Prog Clin Biol Res** 1981;

71:177–96

Reinstatement of cocaine-reinforced responding in the rat. de Wit H, et al. **Psychopharmacology (Berlin)** 1981;75(2):134–43

[Effects of afloqualone, a new centrally acting muscle relaxant, on DRL response and CER in rats (author's transl)] Yamamura M, et al. **Nippon Yakurigaku Zasshi** 1981 Oct;78(4):381–92 (Eng. Abstr.) **(Jpn)**

REINFORCEMENT SCHEDULE

Phencyclidine discrimination in the pigeon using color tracking under second-order schedule. McMillan DE, et al. **J Exp Anal Behav** 1982 Jan;37(1):143–7

RESERPINE

Reserpine-induced supersensitivity and the proliferation of cardiac beta-adrenoceptors. Tenner TE Jr, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):61–5

Electroconvulsive shock and reserpine: effects on beta-adrenergic receptors in rat brain. Kellar KJ, et al. **J Neurochem** 1981 Oct; 37(4):830–6

Effect of an amnesic dose of reserpine, syrosingopine or guanethidine on the levels of whole brain dopamine and norepinephrine in the mouse. Brown OM, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):911–4

[Effect of alpha-methyl-para-tyrosine on 'methamphetamine-induced sterotype and hypermotility' of reserpinized rats (author's transl)] Nakajima H, et al. **Nippon Yakurigaku Zasshi** 1981 Dec;78(6):557–69 (Eng. Abstr.) **(Jpn)**

[Peripheral mechanisms implicated in the interaction of atropine, amphetamine and reserpine on body temperature in the conscious rat] Milanés MV, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):77–8 **(Spa)**

RUBIDIUM

The uptake and extrusion of salts by the halotolerant bacterium, Ba1. Shnaiderman R, et al. **Arch Biochem Biophys** 1982 Jan;213(1):177–85

Amino acid transport and rubidium-ion uptake in monolayer cultures of hepatocytes from neonatal rats. Bellemann P. **Biochem J** 1981 Sep 15; 198(3):475–83

Evaluation of inorganic adsorbents for the rubidium-82 generator: I. Hydrous SnO2. Neirinckx RD, et al. **J Nucl Med** 1982 Mar; 23(3):245–9

The half-life of 87Rb. Akatsu E. **Radioisotopes** 1981 Dec;30(12):647–8

[A factor influencing in vitro the influx of 86Rb+ into erythrocytes as an impurity of a commercial preparation of testosterone (author's transl)] Schreiber V, et al. **Sb Lek** 1981;83(11–12):305–8 (Eng. Abstr.) **(Cze)**

SCHIZOPHRENIA

Fluphenazine and flupenthixol decanoate in psychiatric outpatients practice. Coufal J, et al. **Act Nerv Super (Praha)** 1981;23(4):269–71

Further clinical experience with oxyprothepin-decanoate. Kalvach Z, et al. **Act Nerv Super (Praha)** 1981;23(4):271–2

Penfluridol in chronic schizophrenia. Doongaji DR, et al. **Acta Psychiatr Belg** 1981 Jul–Aug;81(4):407–15

Differentiated psychopharmacotherapy in anxiety states of slowly progressive schizophrenia. Smulevitch A. **Agressologie** 1981 Nov; 22(D):31–2

Diazepam in schizophrenia: a preliminary double-blind trial. Jimerson DC, et al. **Am J Psychiatry** 1982 Apr;139(4):489–91

Abrupt versus gradual withdrawal of antiparkinsonians [letter] Weiner WJ. **Am J Psychiatry** 1982 Feb;139(2):256–7

Serum level monitoring of thiothixene in schizophrenia: acute single-dose levels at fixed doses. Yesavage JA, et al. **Am J Psychiatry** 1982 Feb; 139(2):174–8

Stimulated lymphocytes in schizophrenia. Hirata-Hibi M, et al. **Arch Gen Psychiatry** 1982 Jan;39(1):82–7

Fluphenazine vs placebo in patients with remitted, acute first-episóde schizophrenia. Kane JM, et al. **Arch Gen Psychiatry** 1982 Jan; 39(1):70–3

Antipsychotic effects of ceruletide (caerulein) on chronic schizophrenia [letter] Moroji T, et al. **Arch Gen Psychiatry** 1982 Apr;39(4):485–6

Impaired presynaptic regulation of norepinephrine in schizophrenia. Effects of clonidine in schizophrenic patients and normal controls. Sternberg DE, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):285–9

CSF levels of gamma-aminobutyric acid in schizophrenia. Low values in recently ill patients. van Kammen DP, et al. **Arch Gen Psychiatry** 1982 Jan;39(1):91–7

Plasma copper and dopamine-beta-hydroxylase in schizophrenia. Baron M, et al. **Biol Psychiatry** 1982 Jan;17(1):115–20

Quantitative investigation on the urinary excretion and metabolism of 3,4-dimethoxyphenylethylamine in schizophrenics and normal individuals. Hempel K, et al. **Biol Psychiatry** 1982 Jan;17(1):49–59

The treatment of schizophrenic psychoses with gamma-type endorphins. van Praag HM, et al. **Biol Psychiatry** 1982 Jan;17(1):83–98

Positive and negative schizophrenia symptoms and the role of dopamine. Crow TJ. **Br J Psychiatry** 1981 Sep;139:251–4

Elevated serum levels of lactoferrin and eosinophil cationic protein in schizophrenic patients. Hällgren R, et al. **Br J Psychiatry** 1982 Jan; 140:55–60

Effects of neuroleptic drugs on MAO activity [letter] Reveley AM, et al. **Br J Psychiatry** 1981 Nov;139:475–6

Long term care for the chronic schizophrenic patient. Pyke J, et al. **Can Nurse** 1982 Jan;78(1):37–44

Interaction of chlorpromazine and nortriptyline in patients with schizophrenia. Loga S, et al. **Clin Pharmacokinet** 1981 Nov–Dec; 6(6):454–62

The comprehensive treatment of schizophrenics. Fleck S, et al. **Curr Psychiatr Ther** 1981;20:313–27

The treatment of refractory schizophrenia: pharmacotherapy and clinical implications of blood level measurement of neuroleptics. Pi EH, et al. **Int Pharmacopsychiatry** 1981;16(3):154–61

Pimozide versus chlorpromazine in chronic schizophrenia: a 52 week double-blind study of maintenance therapy. Wilson LG, et al. **J Clin Psychiatry** 1982 Feb;43(2):62–5

Catastrophe theory of dopaminergic transmission: a revised dopamine hypothesis of schizophrenia. King R, et al. **J Theor Biol** 1981 Oct 21; 92(4):373–400

Drug management in chronic schizophrenia. Tune LE, et al. **Johns Hopkins Med J** 1982 Jan;150(1):45–8

Cerebral ventricular size in twins discordant for schizophrenia. Reveley AM, et al. **Lancet** 1982 Mar 6;1(8271):540–1

Action of [Des-Tyr1]-gamma-endorphin in schizophrenia. Emrich HM, et al. **Mod Probl Pharmacopsychiatry** 1981;17:279–86

beta-Endorphin studies in psychiatric patients. Gorelick DA, et al. **Mod Probl Pharmacopsychiatry** 1981;17:236–45

Detoxication treatment of schizophrenic patients: a possible role of endorphins? Nedopil N, et al. **Mod Probl Pharmacopsychiatry** 1981; 17:263–5

The use of dopamine agonists in the treatment of schizophrenia. Conini GU, et al. **Neuropharmacology** 1981 Dec;20(12B):1309–13

Is propranolol antischizophrenic? Peet M. **Neuropharmacology** 1981 Dec; 20(12B):1303–7 (36 ref.)

Endorphins in schizophrenia. van Ree JM, et al. **Neuropharmacology** 1981 Dec;20(12B):1271–7 (93 ref.)

Amphetamine psychosis and schizophrenia: a dual model. Kokkinidis L, et al. **Neurosci Biobehav Rev** 1981 Winter;5(4):449–61 (173 ref.)

Initial improvement as predictor of outcome of neuroleptic treatment. Nedopil N, et al. **Pharmacopsychiatria** 1981 Nov;14(6):205–7

Tolerance to the prolactin-elevating effect of neuroleptics. Brown WA, et al. **Psychiatry Res** 1981 Dec;5(3):317–22

Fine motor performance before and after treatment in schizophrenic and schizoaffective patients. Goode DJ, et al. **Psychiatry Res** 1981 Dec; 5(3):247–55

(Des-tyrosine1)-gamma-endorphin in schizophrenia: clinical, biochemical, and hormonal aspects. Verhoeven WM, et al. **Psychiatry Res** 1981 Dec;5(3):293–309

Does a plasma level of chlorpromazine help? Van Putten T, et al. **Psychol Med** 1981 Nov;11(4):729–34

beta-Endorphin and beta-lipotropin plasma levels in chronic schizophrenia, primary affective disorders and secondary affective disorders. Brambilla F, et al. **Psychoneuroendocrinology** 1981 Dec; 6(4):321–30

The use of fluphenazine decanoate (Modecate)depot therapy in outpatient schizophrenics-a retrospective study. Tan CT, et al. **Singapore Med J** 1981 Aug;22(4):214–8

[Clinical observation on 81 cases of schizophrenia treated with domestic penfluridol (author's transl)] Jin HM. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1981 Aug; 14(3):186–8 **(Chi)**

[Clinical observation on the effect of domestic fluphenazine decanoate in the treatment of schizophrenia——report of 431 cases (author's transl)] Zhang YF. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1981 Aug; 14(3):182–5 **(Chi)**

[Treatment of schizophrenic psychoses by sustained-action neuroleptics in psychiatric outpatients' treatment (author's transl)] Poláček J. **Cesk Psychiatr** 1982 Feb;78(1):49–55 (Eng. Abstr.) **(Cze)**

[Group psychotherapy of chronic schizophrenics in an external milieu]. Filotto JF. **Can J Psychiatry** 1981 Dec;26(8):558–61 (Eng. Abstr.) **(Fre)**

[Biologic therapy of schizophrenia] Lambert PA, et al. **Soins Psychiatr** 1981 Dec;(14):19–22 **(Fre)**

[Biochemical analysis of dopaminergic nerve terminals of post-mortem brain from schizophrenic patients (author's transl)] Toru M, et al. **Seishin Shinkeigaku Zasshi** 1981;83(7):430–47 (Eng. Abstr.) **(Jpn)**

[Various features of dopamine metabolism in schizophrenia] Anokhina IP, et al. **Zh Nevropatol Psikhiatr** 1981;81(9):1343–7 (Eng. Abstr.) **(Rus)**

[Comparison between the effectiveness of fluphenazine decanoate and oxyprothepin decanoate in schizophrenia (double-blind crossover study)] Balon R, et al. **Zh Nevropatol Psikhiatr** 1982;82(1):116–8 (Eng. Abstr.) **(Rus)**

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskii Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) **(Rus)**

[Predicting the effect of psychopharmacotherapy in schizophrenic patients] Dikil NT. **Zh Nevropatol Psikhiatr** 1982;82(1):110-5 (Eng. Abstr.) **(Rus)**

SCHIZOPHRENIA, PARANOID

High doses of haloperidol in schizophrenia. A clinical, biochemical, and pharmacokinetic study. Zarifian E, et al. **Arch Gen Psychiatry** 1982 Feb; 39(2):212-5

Cross-cultural study of a biochemical abnormality in paranoid schizophrenia. Jeste DV, et al. **Psychiatry Res** 1981 Dec;5(3):341-52

The genetics and biochemistry of paranoid schizophrenia and other paranoid psychoses. Kendler KS, et al. **Schizophr Bull** 1981; 7(4):689-709 (86 ref.)

SCHIZOTYPAL PERSONALITY DISORDER

[Psychopharmacologic approach to studying various problems in slowly progressive schizophrenia] Boleloutskii Z. **Zh Nevropatol Psikhiatr** 1982; 82(1):105-10 (Eng. Abstr.) **(Rus)**

SELF STIMULATION

Intracranial self-stimulation. Redgrave P, et al. **Br Med Bull** 1981 May; 37(2):141-6 (71 ref.)

Pimozide attenuates conditioned taste preferences induced by self-stimulation in rats. Ettenberg A, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):915-9

Brain reinforcement mechanisms: alpha-adrenergic and dopaminergic agonists and antagonists. Wauquier A, et al. **Prog Clin Biol Res** 1981; 71:177-96

SEROTONIN

LCEC analysis of 5-hydroxytryptamine and norepinephrine in the human gastrointestinal tract. Smeds S, et al. **Acta Chir Scand** 1981; 147(5):361-2

The effect of intrahypothalamic serotonin reinforcement on directional preference in rats. Lesiecka M, et al. **Acta Neurobiol Exp (Warsz)** 1981; 41(5):439-46

Halothane inhibits the pulmonary clearance of 5-hydroxytryptamine in isolated perfused rat lungs [letter] Hede AR, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):239-40

Role of some biogenic amines in the pathomechanism of glomerulonephritis. II. Adrenaline, noradrenaline and serotonin in acute serum sickness in rabbits. Gębala A, et al. **Acta Physiol Pol** 1981; 32(4):363-73

Role of some biogenic amines in the pathomechanism of glomerulonephritis. Zajączkowska M, et al. **Acta Physiol Pol** 1981; 32(4):375-82

Entrainment of the circadian rhythm from the eye of Aplysia: role of serotonin. Corrent G, et al. **Am J Physiol** 1982 Mar;242(3):R326-32

Transmitterlike action of serotonin in phase shifting a rhythm from the Aplysia eye. Corrent G, et al. **Am J Physiol** 1982 Mar; 242(3):R333-8

Biochemical differences in children with conduct disorder socialized and undersocialized. Rogeness GA, et al. **Am J Psychiatry** 1982 Mar; 139(3):307-11

Effects of carotid Body chemoreceptor stimulation by 5-HT on phrenic nerve activity and ventilation in the rabbit. Matsumoto S. **Arch Int Pharmacodyn Ther** 1981 Dec;254(2):282-92

Direct and indirect actions of 5-hydroxytryptamine in the rat anococcygeus muscle. Oriowo MA. **Arch Int Pharmacodyn Ther** 1981 Nov;254(1):13-9

Comparison of the cardiovascular responses to intracerebroventricular administration of tryptamine, 5-hydroxytryptamine, tryptophan and 5-hydroxytryptophan in rats. Krstić MK, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):385-91

Correlation of inbibitory activity of tryptamine derivatives on serotonin uptake in thrombocyte with van der Waals volume. Gupta SP, et al. **Arzneimittelforsch** 1981;31(12):2053-5

The effect of PEA on serotonin and catecholamines. Widelitz MM, et al. **Biochem Biophys Res Commun** 1981 Dec 15;103(3):1107-11

Immunoglobulin E decapeptide-induced 5-hydroxytryptamine release from rat peritoneal mast cells. Comparison with corticotropin-(1-24)-peptide, polyarginine, polylysine and antigen. Coleman JW, et al. **Biochem J** 1981 Sep 15;198(3):615-9

Participation of a transmembrane proton gradient in 5-hydroxytryptamine transport by platelet dense granules and dense-granule ghosts. Wilkins JA, et al. **Biochem J** 1981 Jul 15;198(1):113-23

K+-evoked [3H]-5-HT release from rat frontal cortex slices: the effect of 5-HT agonists and antagonists. Mounsey I, et al. **Biochem Pharmacol** 1982 Jan 1;31(1):49-53

Behavioral effects and physiological disposition of some beta-hydroxylated indoleamines in the rat. Gentile NT, et al. **Biol Psychiatry** 1982 Jan;17(1):109-13

Platelet serotonin uptake in depressed patients: circadian effect. Rausch JL, et al. **Biol Psychiatry** 1982 Jan;17(1):121-3

Cerebral circulatory response to hypercapnia: effects of lesions of central dopaminergic and serotoninergic neuron systems. Dahlgren N, et al. **Brain Res** 1981 Dec 28;230(1-2):221-33

Altered neuronal responsiveness to biogenic amines in rat cerebral cortex after serotonin denervation or depletion. Ferron A, et al. **Brain Res** 1982 Jan 7;231(1):93-108

Evidence for GABA receptors on serotonergic afferent terminals in the substantia nigra and on nigral efferent projections to the caudal mesencephalon. Gale K. **Brain Res** 1982 Jan 7;231(1):209-15

Sensory stimuli differentially affect in vivo nigral and striatal [3H]serotonin release in the cat. Reisine T, et al. **Brain Res** 1982 Jan 28;232(1):77-87

Fetal raphe and hippocampal transplants into adult and aged C57BL/6N mice: a preliminary immunocytochemical study. Azmitia EC, et al. **Brain Res Bull** 1981 Dec;7(6):703-10

Effects of ovarian steroids on serotonin metabolism within grossly dissected and microdissected brain regions of the ovariectomized rat. Cone RI, et al. **Brain Res Bull** 1981 Dec;7(6):639-44

Chemoreceptors for serotonin (5-HT), acetylcholine (ACh), bradykinin (BK), histamine (H) and gamma-aminobutyric acid (GABA) on rabbit visceral afferent neurons. Higashi H, et al. **Brain Res Bull** 1982 Jan; 8(1):23-32

5-HT receptors and hyper- or hypothermia: elucidation by catecholamine antagonists injected into the cat hypothalamus. Ruwe WD, et al. **Brain Res Bull** 1982 Jan;8(1):79-86

Effect of dl-3-pyridylalanine on serotonin concentration and tryptophan-serotonin metabolizing enzymes in rats. Shimeno H, et al. **Chem Pharm Bull (Tokyo)** 1981 Oct;29(10):2940-8

Modification of the drug talking behavior in rats by interference in the metabolism of 5-hydroxytryptamine and catecholamines. Fuchs V, et al. **Drug Alcohol Depend** 1981 Nov;8(3):235-44

Distribution of catecholamines and serotonin in 17 portions of rat ventromedial nucleus and effect of acute immobilization stress. Kiss A, et al. **Endocrinol Exp (Bratisl)** 1981 Dec;15(4):219-28

Specific in vitro upteke of serotonin by cells in the anterior pituitary of the rat. Johns MA, et al. **Endocrinology** 1982 Mar;110(3):754-60

Effect of Mount St. Helens ash on the response of rat trachea to smooth muscle agonists. Fedan JS, et al. **Environ Res** 1981 Dec; 26(2):497-502

Effect of 1-aminoadamantanes on adenine nucleotide and serotonin storage in blood platelets. Wesemann W, et al. **Eur J Cell Biol** 1981 Dec;26(1):158-67

The effect of some anti-epilepsy drugs on enhancement of the monoamine-mediated behavioural responses following the administration of electroconvulsive shocks to rats. Bhavsar VH, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):243-7

Adenosine contracts the isolated rat tail artery by releasing endogenous 5-hydroxytryptamine. Brown CM, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):275-7

The effects of 5-hydroxytryptamine-depleting drugs on peptides in the ventral spinal cord. Gilbert RF, et al. **Eur J Pharmacol** 1981 Dec 3; 76(2-3):203-10

Interaction between 5-hydroxytryptamine and other vasoconstrictor substances in the isolated femoral artery of the rabbit; effect of ketanserin (R 41 468). Van Nueten JM, et al. **Eur J Pharmacol** 1982 Feb 5; 77(4):281-7

5-Hydroxytryptamine in the retina of some mammals. Ehinger B, et al. **Exp Eye Res** 1981 Dec;33(6):663-72

Nuclear magnetic resonance studies of amine storage in pig platelets. Costa JL, et al. **FEBS Lett** 1981 Dec 28;136(2):325-8

Effect of diethylpyrocarbonate on pH-driven monoamine uptake by chromaffin granule ghosts. Isambert MF, et al. **FEBS Lett** 1981 Dec 21;136(1):13-8

The effects of the specific uptake inhibitor Lu 10-171 (citalopram) upon brain indoleamine stores in the maturing mouse. Baker PC, et al. **Gen Pharmacol** 1982;13(1):59-61

Autoradiography of (3H)-5-hydroxytryptamine uptake in the retina of some mammals. Ehinger B, et al. **Graefes Arch Clin Exp Ophthalmol** 1982;218(1):1-8

Glial uptake of monoamines in primary cultures of rat median raphe nucleus and cerebellum. A combined monoamine fluorescence and glial fibrillary acidic protein immunofluorescence study. Liesi P, et al. **Histochemistry** 1981;73(2):239-50

Comparative study on biological activities of various anaphylatoxins (C4a, C3a, C5a). Investigations on their ability to induce platelet secretion. Meuer S, et al. **Inflammation** 1981 Dec;5(4):263-73

Increased serotonin level via augmented tryptophan diet and its effect on escape learning. Yehuda S, et al. **Int J Neurosci** 1981; 15(4):193-6

Effects of 5-hydroxytryptamine on neuroeffector junction in human pulmonary artery. Freeman WK, et al. **J Appl Physiol** 1981 Sep; 51(3):693-8

Coupling of transmembrane proton gradients to platelet serotonin transport. Keyes SR, et al. **J Biol Chem** 1982 Feb 10;257(3):1172–6

Pharmacology of arterioles: some aspects of variability in response to norepinephrine, histamine, and 5-hydroxytryptamine. Burrows ME, et al. **J Cardiovasc Pharmacol** 1981 Nov–Dec;3(6):1370–80

Determination of 5-hydroxytryptophan, serotonin and 5-hydroxyindoleacetic acid in rat and human brain and biological fluids by reversed-phase high-performance liquid chromatography with electrochemical detection. Semerdjian-Rouquier L, et al. **J Chromatogr** 1981 Nov 20;218:663–70

Bilateral serotonergic projections to the dorsal hippocampus of the rat: simultaneous localization of 3H-5HT and HRP after retrograde transport. Azmitia EC. **J Comp Neurol** 1981 Dec 20;203(4):737–43

Identification of and interactions between noradrenergic and serotonergic neurites in the myenteric plexus. Gershon MD, et al. **J Comp Neurol** 1982 Feb 1;204(4):407–21

The level of N-acetylserotonin and melatonin in the brain of male rats: diurnal variations and effects of pinealectomy. Pang SF, et al. **J Exp Zool** 1982 Feb 20;219(3):271–6

Immunocytochemical detection of serotonin with monoclonal antibodies. Consolazione A, et al. **J Histochem Cytochem** 1981 Dec; 29(12):1425–30

Uptake of 5-hydroxytryptamine by gonadotrophs of the bat's pituitary: A combined immunocytochemical radioautographic analysis. Nunez EA, et al. **J Histochem Cytochem** 1981 Nov;29(11):1336–46

Influence of innervation on the levels of noradrenaline and serotonin in the circumvallate papilla of the rat. Cano J, et al. **J Neurobiol** 1982 Jan;13(1):1–7

Effects of long-term low dietary tryptophan intake on determinants of 5-hydroxytryptamine metabolism in the brains of young rats. Ashley DV, et al. **J Neurochem** 1981 Dec;37(6):1385–93

Serotonin and gamma-aminobutyric acid turnover after injection into the median raphe of substance P and D-ala-met-enkephalin amide. Forchetti CM, et al. **J Neurochem** 1982 May;38(5):1336–41

Deamination of 5-hydroxytryptamine by both forms of monoamine oxidase in the rat brain. Fowler CJ, et al. **J Neurochem** 1982 Mar; 38(3):733–6

Presence of conjugated 5-hydroxytryptamine in in vivo superfusates of rat spinal cord. Hammond DL, et al. **J Neurochem** 1981 Oct; 37(4):1068–71

The effects of chronic manganese chloride treatment expressed as age-dependent, transient changes in rat brain synaptosomal uptake of amines. Lai JC, et al. **J Neurochem** 1982 Mar;38(3):844–7

Simultaneous determination of serotonin, 5-hydroxindoleacetic acid, 3,4-dihydroxyphenylacetic acid and homovanillic acid by high performance liquid chromatography with electrochemical detection. Sperk G. **J Neurochem** 1982 Mar;38(3):840–3

Correlative firing patterns of serotonergic neurons in rat dorsal raphe nucleus. Wang RY, et al. **J Neurosci** 1982 Jan;2(1):11–6

Possible hazards in serotonin binding assays in human and rat brain: effects of ascorbate, pargyline, and buffer concentration. Weiner N, et al. **J Neurosci Methods** 1982 Jan;5(1–2):41–5

Chronic treatment with haloperidol or fluphenazine decanoate: regional effects on dopamine and serotonin metabolism in primate brain. Bacopoulos NG, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):22–8

Depression of serotonin uptake by rat lungs exposed to paraquat. Block ER, et al. **J Pharmacol Exp Ther** 1982 Apr;221(1):254–60

Long-term infusion of L-5-hydroxytryptophan increases brain serotonin turnover and decreases blood pressure in normotensive rats. Echizen H, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):579–84

The effects of stereoisomers of 2- and 9- aminobenzonorbornenes on food intake, brain serotonin concentration and monoamine oxidase activity in the rat. Gray NM, et al. **J Pharmacol Exp Ther** 1982 Apr; 221(1):58–62

Apomorphine-induced aggression in rats chronically treated with oral clonidine: modulation by central serotonergic mechanisms. Hahn RA, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):389–93

gamma-Aminobutyric acid (GABA) receptor stimulation. III. Effect of progabide (SL 76002) on norepinephrine, dopamine and 5-hydroxytryptamine turnover in rat brain areas. Scatton B, et al. **J Pharmacol Exp Ther** 1982 Mar;220(3):678–88

Applicability of models for carrier-mediated serotonin transport to pools of serotonin in intact human platelets. Costa JL, et al. **J Physiol (Lond)** 1981 Jul;316:153–61

Action of 5-hydroxytryptamine on intestinal ion transport in the rat. Hardcastle J, et al. **J Physiol (Lond)** 1981 Nov;320:41–55

Mediators of slow synaptic potentials in the myenteric plexus of the guinea-pig ileum. Johnson SM, et al. **J Physiol (Lond)** 1981 Nov; 320:175–86

Hallucinogens as discriminative stimuli: a comparison of 4-OMe DMT and 5-OMe DMT with their methythio counterparts. Glennon RA, et al. **Life Sci** 1982 Feb 1;30(5):465–7

Defective serotonin transport mechanism in platelets from endogenously depressed patients. Malmgren R, et al. **Life Sci** 1981 Dec 21; 29(25):2649–58

Effect of 5-hydroxytryptamine (5-HT; serotonin) on in vitro glucose uptake and glycogen reserves in Hymenolepis diminuta. Mettrick DF, et al. **Mol Biochem Parasitol** 1981 Dec;4(3–4):217–23

Dopamine- and serotonin-sensitive adenylate cyclase in the fill of Aplysia californica. Weiss S, et al. **Mol Pharmacol** 1981 Nov;20(3):592–7

Serotonin-activated adenylate cyclase during early development of Schistosoma mansoni. Kasschau MR, et al. **Nature** 1982 Mar; 296(5852):66–8

Characterization of the receptor subtype involved in alpha-adrenoceptor-mediated modulation of serotonin release from rat brain cortex slices. Göthert M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981 Nov;317(3):199–203

3H-Imipramine binding sites in the rat brain. Selective localization on serotoninergic neurones. Gross G, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1981;317(4):310–4

3H-Noradrenaline and 3H-5-hydroxytryptamine release from rat brain slices and its presynaptic alpha-adrenergic modulation after long-term desipramine pretreatment. Schoffelmeer AN, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1982 Feb;318(3):173–80

Dissociation of the effects of gonadal steroids on brain serotonin metabolism and sexual behavior in the male rat. Bradshaw WG, et al. **Neuroendocrinology** 1982 Jan;34(1):38–45

Evidence that the effects of 5-hydroxytryptophan on the secretion of ACTH and growth hormone in dogs are not mediated by central release of serotonin. Zimmermann H, et al. **Neuroendocrinology** 1982 Jan; 34(1):27–31

Differential involvement of dopamine-containing tracts in 5-hydroxytryptamine-dependent behaviours caused by amphetamine in large doses. Andrews CD, et al. **Neuropharmacology** 1982 Jan; 21(1):63–8

Long-term effects of methamphetamine on the synthesis and metabolism of 5-hydroxytryptamine in various regions of the rat brain. Bakhit C, et al. **Neuropharmacology** 1981 Dec;20(12A):1135–40

Behavioural effects of acute and chronic beta-phenylethylamine administration in the rat: evidence for the involvement of 5-hydroxytryptamine. Dourish CT. **Neuropharmacology** 1981 Nov; 20(11):1067–72

In vivo voltammetry in the rat hippocampus as in index of drug effects on extraneuronal 5-HT. Joseph MH, et al. **Neuropharmacology** 1981 Dec;20(12B):1361–4

The effect of niaprazine on the turnover of 5-hydroxytryptamine in the rat brain. Keane PE, et al. **Neuropharmacology** 1982 Feb;21(2):163–9

Ketamine inhibits serotonin uptake in vivo. Martin LL, et al. **Neuropharmacology** 1982 Feb;21(2):113–8

Ketamine inhibits serotonin synthesis and metabolism in vivo. Martin LL, et al. **Neuropharmacology** 1982 Feb;21(2):119–25

Lidocaine selectively diminishes medullary serotonin metabolism in the rat. Riker DK, et al. **Neuropharmacology** 1981 Dec;20(12A):1233–6

Depolarizing responses recorded from nodose ganglion cells of the rabbit evoked by 5-hydroxytryptamine and other substances. Wallis DI, et al. **Neuropharmacology** 1982 Jan;21(1):31–40

Effect of serotonin injected into the amygdala on conditioned and unconditioned food reflexes and the EEG in cats. Gasanov GG, et al. **Neurosci Behav Physiol** 1981 May–Jun;11(3):207–12

Effect of serotonin on formation and fixation of various conditioned reflexes. Getsova VM. **Neurosci Behav Physiol** 1981 May–Jun; 11(3):280–5

5-hydroxytryptophan uptake in indoleaminergic nerve fibers within rat cerebrovascular tree. Napoleone P, et al. **Neurosci Lett** 1982 Jan 22; 28(1):57–60

The importance of 5-hydroxytryptamine turnover for the analgesic effect of morphine in the chicken. Fan SG, et al. **Neuroscience** 1981; 6(11):2223–7

Release of endogenous 5-hydroxytryptamine from resting and stimulated enteric neurons. Gershon MD, et al. **Neuroscience** 1981; 6(11):2277–86

Arginine vasotocin: effects on open field behavior, whole brain monoamines and plasma corticosterone. Golus P, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):437–40

Possible mechanism of 5-methoxy-N,N-dimethyltryptamine-induced turning behaviour in DRN lesioned rats. Blackburn TP, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):7–11

Measurement of metabolites of dopamine and 5-hydroxytryptamine in cerebroventricular perfusates of unanesthetized, freely-moving rats: selective effects of drugs. Nielsen JA, et al. **Pharmacol Biochem Behav** 1982 Jan;16(1):131–7

Adrenalectomy reverses the effects of delta-9-THC on mouse brain 5-hydroxytryptamine turnover. Johnson KM, et al. **Pharmacology** 1981; 23(4):223–9

The effect of pyrazidol on the central serotonergic system. Sypniewska M, et al. **Pol J Pharmacol Pharm** 1981;33(3):313–9

Acute and chronic effects of pentobarbital on 5-hydroxytryptamine in mouse brain. Nabeshima T, et al. **Prog Neuropsychopharmacol** 1981; 5(4):373–81

Role played by serotonin in the control of estrous receptivity. Ovarian activity and ovulation in the cyclic female rat. Satli MA, et al. **Psychoneuroendocrinology** 1981;6(2):121–9

CNS mediated inhibition of gastric secretion by bombesin: independence from interaction with brain catecholaminergic, and serotoninergic pathways and pituitary hormones. Taché Y, et al. **Regul Pept** 1982 Jan; 3(1):51–9

Structural specificity of the inhibition of serotonin accumulation in rat lung slices. Mais DE, et al. **Res Commun Chem Pathol Pharmacol** 1981 Nov;34(2):241–50

Uptake mechanisms of 5–HT in pancreatic beta–cells. Lindström P, et al. **Ups J Med Sci** 1981;86(2):143–8

Evidence for a serotonin neurotransmitter system in bovine retina. Redburn DA, et al. **Vision Res** 1981;21(11):1673–6

[Pharmacology of puerarin. V. Effects of puerarin on platelet aggregation and release of 5–HT from platelets] Yin ZZ, et al. **Chung Kuo I Hsueh Ko Hsueh Yuan Hsueh Pao** 1981 Jun; 3 Suppl 1:44–7 (Eng. Abstr.) **(Chi)**

[Demonstration of glutamate decarboxylase and serotonin in the same neuron of the nucleus raphe dorsalis of the rat by the methods of immunocytochemical doubling labelling] Belin MF, et al. **C R Seances Acad Sci [III]** 1981 Oct 19;293(6):337–41 **(Fre)**

[Effects of cigarette smoking on pulmonary functions and on plasma levels of serotonin, histamine and serum angiotensin I converting enzyme activity (author's transl)] Ishihara Y, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1981 Oct;19(10):721–7 (Eng. Abstr.) **(Jpn)**

[Sites responsible for stimulation of brain Na,K–ATPase by serotonin] Novitskaia NA, et al. **Biokhimiia** 1981 Nov;46(11):1981–3 (Eng. Abstr.) **(Rus)**

[Catecholaminergic and serotoninergic systems in depression] Puzhin'skiĭ S, et al. **Vestn Akad Med Nauk SSSR** 1982;(1):66–8 (Eng. Abstr.) **(Rus)**

SEX BEHAVIOR, ANIMAL

Inhibition of lordosis behavior in the female rat by intraventricular infusion of prolactin and by chronic hyperprolactinemia. Dudley CA, et al. **Endocrinology** 1982 Feb;110(2):677–9

Sex hormones and neurotransmitters as mediators for sexual differentiation of the brain. Dörner G. **Endokrinologie** 1981 Dec;78(2–3):129–38 (31 ref.)

Differential effects of bromocriptine treatment on LH release and copulatory behavior in hyperprolactinemic male rats. Doherty PC, et al. **Horm Behav** 1981 Dec;15(4):436–50

Dissociation of the effects of gonadal steroids on brain serotonin metabolism and sexual behavior in the male rat. Bradshaw WG, et al. **Neuroendocrinology** 1982 Jan;34(1):38–45

The effect of LHRH antagonist analogs and an antibody to LHRH on mating behavior in female rats. Dudley CA, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):393–6

Facilitation of sexual receptivity in the rat by an ovulation–inhibiting analog of LHRH. Zadina JE, et al. **Pharmacol Biochem Behav** 1981 Dec;15(6):961–4

Female sexual behaviour in the GnRH deficient, hypogonadal (hpg) mouse. Ward BJ, et al. **Physiol Behav** 1981 Dec;27(6):1107–9

Role played by serotonin in the control of estrous receptivity. Ovarian activity and ovulation in the cyclic female rat. Satli MA, et al. **Psychoneuroendocrinology** 1981;6(2):121–9

SLEEP

Effects of oxolinic acid on the sleep–wakefulness cycle of the rat. D'Angelo L, et al. **Br J Pharmacol** 1981 Oct;74(2):399–404

Effect of phenobarbital on sleep and nighttime plasma growth hormone and cortisol levels. Prinz PN, et al. **Can J Physiol Pharmacol** 1981 Nov; 59(11):1139–45

Difference in tolerance development of hypothermia and pentobarbital–induced sleep prolongating effect of 11–hydroxy–delta 8–tetrahydrocannabinol and 11–oxo–delta 8–tetrahydrocannabinol in mice. Watanabe K, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):53–6

Further studies on the determinant role of brain level of pentobarbital for the development of acute hypnotic tolerance. Kaneto H, et al. **J Pharmacobiodyn** 1981 Sep;4(9):700–5

[Night sleep study in chronic psychotics under long term flupenthixol treatment (author's transl)] Serbanescou T, et al. **Encephale** 1981; 7(5):623–9 (Eng. Abstr.) **(Fre)**

SLEEP DEPRIVATION

[Antidepressive effect of partial sleep deprivation during the 1st half of the night] Goetze U, et al. **Psychiatr Clin (Basel)** 1981;14(3):129–49 (Eng. Abstr.) **(Ger)**

SLEEP, REM

Duration of REM sleep latency as predictor of effect of antidepressant therapy. A preliminary report. Svendsen K, et al. **Acta Psychiatr Scand** 1981 Sep;64(3):238–43

[Decrease of paradoxical sleep in the rat under tricyclic antidepressant: the role of collateral inhibition (author's transl)] Justafre JC, et al. **Rev Electroencephalogr Neurophysiol Clin** 1981 Nov;11(2):228–35 (Eng. Abstr.) **(Fre)**

[The effects of butoctamide hydrogen succinate (BAHS) on the sleep of the aged people (author's transl)] Hayashi Y, et al. **No To Shinkei** 1981 Dec;33(12):1243–50 (Eng. Abstr.) **(Jpn)**

SLEEP STAGES

EEG spectral analysis in vital depression: ultradian cycles. Lange H. **Biol Psychiatry** 1982 Jan;17(1):3–21

Neuronal discharge patterns in the occipital cortex of developing rats during active and quiet sleep. Mirmiran M, et al. **Brain Res** 1982 Jan; 255(1):37–48

Sleep suppressant action of quipazine: relation to central serotonergic stimulation. Fornal C, et al. **Pharmacol Biochem Behav** 1981 Dec; 15(6):937–44

[Effects of afloqualone, a centrally acting muscle relaxant, on the sleep–wakefulness cycle in cats with chronically implanted electrodes (author's transl)] Kojima M, et al. **Nippon Yakurigaku Zasshi** 1981 Nov; 78(5):471–82 (Eng. Abstr.) **(Jpn)**

SOCIAL ADJUSTMENT

The effects of labeling: blind and nonblind ratings of social skills in schizophrenic and nonschizophrenic control subjects. Lindsay WR. **Am J Psychiatry** 1982 Feb;139(2):216–9

SODIUM

The concentrations of trace elements in blood from healthy newborn infants. Meurling S, et al. **Acta Chir Scand** 1981;147(6):481–5

Effects of ACTH on the zona glomerulosa of sodium–loaded timolol maleate–treated rats: stereology and plasma hormone concentrations. Nussdorfer GG, et al. **Acta Endocrinol (Copenh)** 1982 Feb; 99(2):256–62

Sodium intake alters the effects of norepinephrine on the renin system and the kidney. Rankin LI, et al. **Am J Kidney Dis** 1981 Nov; 1(3):177–84

Aldosterone and the enhanced natriuresis of hypertonic infusions in the dog. Childers JW, et al. **Am J Physiol** 1982 Jan;242(1):F30–7

Effect of tryptophan on transport properties of newborn rabbit jejunum. Cooke HJ, et al. **Am J Physiol** 1982 Apr;242(4):G308–12

The uptake and extrusion of salts by the halotolerant bacterium, Ba1. Shnaiderman R, et al. **Arch Biochem Biophys** 1982 Jan;213(1):177–85

Synthesis and migration of proteins and glycoproteins in juxtaglomerular cells of sodium–deficient rats. An ultrastructural radioautographic study. Désormeaux Y, et al. **Cell Tissue Res** 1982 Jan;222(1):53–67

Dietary sodium, erythrocyte sodium concentration, sodium–stimulated lithium efflux and blood pressure. Trevisan M, et al. **Clin Sci [Suppl]** 1981 Dec;61(7):29s–32s

Sodium– and calcium–dependent somatostatin release from dissociated cerebral cortical cells in culture. Robbins RJ, et al. **Endocrinology** 1982 Feb;110(2):496–9

Discrepancy in the regulatory effects of sodium and guanine nucleotides on adrenaline and clonidine binding to alpha 2–adrenoceptors in human fat cell membranes. Gonzalez JL, et al. **Eur J Pharmacol** 1981 Dec 3;76(2–3):289–93

Competitive inhibition of sodium–dependent high affinity choline uptake by harmala alkaloids. Smart L. **Eur J Pharmacol** 1981 Nov 5; 75(4):265–9

Effect of Na+, K+ and Li+ on pH dependence of in situ beta–galactosidase from E. coli. de Arriaga D, et al. **Int J Biochem**

1982;14(1):47-52

Furosemide-sensitive salt transport in the Madin-Darby canine kidney cell line. Evidence for the cotransport of Na+, K+, and Cl-. McRoberts JA, et al. **J Biol Chem** 1982 Mar 10;257(5):2260-6

(Na+,K+)-cotransport in the Madin-Darby canine kidney cell line. Kinetic characterization of the interaction between Na+ and K+. Rindler MJ, et al. **J Biol Chem** 1982 Mar 10;257(5):2254-9

Influence of sodium and sulphydryl groups on [3H]sulpiride binding sites in rat striatal membranes. Freedman SB, et al. **J Neurochem** 1982 May; 38(5):1459-65

Ontogenetic development of the striatal [3H]spiperone binding: regulation by sodium and guanine nucleotide in rats. Nomura Y, et al. **J Neurochem** 1982 Apr;38(4):902-8

Inhibition by somatostatin of bovine growth hormone secretion following sodium channel activation. Bicknell RJ, et al. **J Physiol (Lond)** 1981 Jul;316:85-96

The interaction of potassium ions and ATP on the sodium pump of resealed red cell ghosts. Eisner DA, et al. **J Physiol (Lond)** 1981; 319:403-18

Internal potassium stimulates the sodium-potassium pump by increasing cell ATP concentration. Sachs JR. **J Physiol (Lond)** 1981; 319:515-28

Calcium-dependent secretion of catecholamines from the perfused bovine adrenal medulla by sodium deprivation. Sorimachi M, et al. **Jpn J Physiol** 1981;31(5):753-56

On the mechanism of the inhibition of fast axonal transport caused by exposure of frog spinal ganglia to the sodium-deficient medium. Lavoie PA. **Neurosci Lett** 1981 Dec 11;27(2):131-4

Ionic mechanisms of alpha-autoinhibition of [3H]noradrenaline secretion in guinea-pig vas deferens: possible role of extracellular sodium. Stjärne L. **Neuroscience** 1981;6(12):2759-71

Catecholamines and the sodium pump in excitable cells. Phillis JW, et al. **Prog Neurobiol** 1981;17(3):141-84 (320 ref.)

[Effect of the structural integrity of Na,K-ATPase preparations on the ability of lithium to substitute for sodium in enzyme activation] Skul'skil IA, et al. **Tsitologiia** 1982 Jan;24(1):95-8 (Eng. Abstr.) **(Rus)**

SOMATOTROPIN RELEASE INHIBITING HORMONE

Tolbutamide, glucose, calcium, and somatostatin secretion. Hermansen K. **Acta Endocrinol (Copenh)** 1982 Jan;99(1):86-93

Effect of somatostatin on determinants of bile flow in unanesthetized dogs. Lewis MH, et al. **Ann Surg** 1982 Jan;195(1):97-103

Studies on the mechanism of action of somatostatin on renal gluconeogenesis: evidence for the involvement of alpha 1-adrenergic stimuli. Dileepan KN, et al. **Arch Biochem Biophys** 1982 Jan; 213(1):169-76

High-field 1H NMR studies of synthetic analogs of somatostatin. Structural features involving aromatic residues in an active eight-membered ring analog. Cutnell JD, et al. **Biochim Biophys Acta** 1982 Jan 4;700(1):59-66

The interaction of glucagon, gastric inhibitory peptide and somatostatin with cyclic AMP production systems present in rat gastric glands. Gespach C, et al. **Biochim Biophys Acta** 1982 Feb 10;720(1):7-16

The conformational properties of somatostatin. IV. The conformers contributing to the conformation equilibrium of somatostatin in aqueous solution as found by semi-empirical energy calculations and high-resolution NMR experiments. Knappenberg M, et al. **Biochim Biophys Acta** 1982 Jan 18;700(2):229-46

Topography of median eminence somatostatinergic innervation. Epelbaum J, et al. **Brain Res** 1981 Dec 28;230(1-2):412-6

The actions of neuropeptides on dorsal horn neurons in the rat spinal cord slice preparation: an intracellular study. Murase K, et al. **Brain Res** 1982 Feb 18;234(1):170-6

Effects of neurotransmitters and cyclic AMP on somatostatin release from cultured cerebral cortical cells. Robbins RJ, et al. **Brain Res** 1982 Feb 25;234(2):377-86

Distribution of somatostatin in the mouse brain: effects of neonatal MSG treatment. Romagnano MA, et al. **Brain Res** 1982 Feb 25; 234(2):387-98

Somatostatin inhibits prolactin secretion in the estradiol primed male rat. Cooper GR, et al. **Can J Physiol Pharmacol** 1981 Oct;59(10):1082-8

Distribution of neuropeptides in the dorsal pontine tegmental area of the rat. Matsuzaki T, et al. **Cell Mol Biol** 1981;27(5):499-508

Immunocytochemical localization of hormone-producing cells within the pancreatic islets of the rainbow trout (Salmo gairdneri). Wagner GF, et al. **Cell Tissue Res** 1981;221(1):181-92

Influence of somatostatin on plasma cyclic AMP and metabolic substrate responses to i.v. adrenaline and glucagon in humans. Nistrup Madsen S, et al. **Clin Endocrinol (Oxf)** 1981 Nov;15(5):431-7

Effects of K+ and arginine on insulin, glucagon, and somatostatin release from the in vitro perfused rat pancreas. Frankel BJ, et al. **Endocrinology** 1982 Feb;110(2):428-31

Effects of somatostatin and urotensin II on tilapia pituitary prolactin release and interactions between somatostatin, osmotic pressure Ca++, and adenosine 3',5'-monophosphate in prolactin release in vitro. Grau EG, et al. **Endocrinology** 1982 Mar;110(3):910-5

High somatostatin uptake by the isolated perfused dog pancreas consistent with 'insulo-acinar' axis. Kawai K, et al. **Endocrinology** 1982 Feb; 110(2):660-2

Influence of endogenous somatostatin on growth hormone and thyrotropin secretion in neonatal rats. Oliver C, et al. **Endocrinology** 1982 Mar; 110(3):1018-22

Sodium- and calcium-dependent somatostatin release from dissociated cerebral cortical cells in culture. Robbins RJ, et al. **Endocrinology** 1982 Feb;110(2):496-9

Selective processing of the 15 000 Mr prosomatostatin by mouse hypothalamic extracts releases the tetradecapeptide. Morel A, et al. **FEBS Lett** 1981 Dec 28;136(2):316-8

Effect of food deprivation on rat gastric somatostatin and gastrin release. Koop H, et al. **Gastroenterology** 1982 May;82(5 Pt 1):871-6

Abnormalities of the colonic regulatory peptides in Hirschsprung's disease. Bishop AE, et al. **Histopathology** 1981 Nov;5(6):679-88

Route of administration as a factor in the selectivity of hormone suppression of a somatostatin analog in rats. Lien EL, et al. **Horm Metab Res** 1981 Dec;13(12):675-8

Infusion of somatostatin antiserum in the rat—failure to raise stress induced low gastric acid secretion. Schwille PO, et al. **Horm Metab Res** 1981 Dec;13(12):710-1

Pituitary somatostatin receptors. Characterization by binding with a nondegradable peptide analogue. Aguilera G, et al. **J Biol Chem** 1982 Feb 10;257(3):1134-7

Localization of methionine-enkephalin, substance P, and somatostatin immunoreactivities in the main olfactory bulb of the hamster. Davis BJ, et al. **J Comp Neurol** 1982 Feb 1;204(4):377-83

Ontogeny of somatostatin-containing neuron system of the rat: immunohistochemical analysis. II. Forebrain and diencephalon. Shiosaka S, et al. **J Comp Neurol** 1982 Jan 20;204(3):211-24

Evidence for ascending and descending intraspinal as well as primary sensory somatostatin projections in the rat spinal cord. Stine SM, et al. **J Neurochem** 1982 Apr;38(4):1144-50

Depletion of somatostatin-like immunoreactivity in the rat central nervous system by cysteamine. Sagar SM, et al. **J Neurosci** 1982 Feb; 2(2):225-31

Inhibition by somatostatin of bovine growth hormone secretion following sodium channel activation. Bicknell RJ, et al. **J Physiol (Lond)** 1981 Jul;316:85-96

A role of endogenous somatostatin and glucagon in insulin release from pancreatic islets. Taniguchi H, et al. **Kobe J Med Sci** 1981 Dec; 27(6):213-24

A survey of substance P, somatostatin, and neurotensin levels in aging in the rat and human central nervous system. Buck SH, et al. **Neurobiol Aging** 1981 Winter;2(4):257-64

Somatostatin immunoreactive cell bodies in the dorsal horn and the parasympathetic intermediolateral nucleus of the rat spinal cord. Dalsgaard CJ, et al. **Neurosci Lett** 1981 Dec 23;27(3):335-9

Developmental changes in bombesin, substance P, somatostatin and vasoactive intestinal polypeptide in the rat brain. McGregor GP, et al. **Neurosci Lett** 1982 Jan 22;28(1):21-7

Discrete distributions of putative cholinergic and somatostatinergic amacrine cell dendrites in chicken retina. Morgan IG, et al. **Neurosci Lett** 1981 Nov 18;27(1):55-60

The immunocytochemical localization of somatostatin-containing neurons in the rat central nervous system. Finley JC, et al. **Neuroscience** 1981; 6(11):2173-92

Presence of somatostatin-28-(1-12) in hypothalamus and pancreas. Benoit R, et al. **Proc Natl Acad Sci USA** 1982 Feb;79(3):917-21

Effect of parathyroid hormone on gastrin and somatostatin release from the gastric antrum. Selking O, et al. **Ups J Med Sci** 1981; 86(3):259-67

[Inhibition of growth-hormone release in man: comparative study between somatostatin-14 and -28 (author's transl)] Pradayrol L, et al. **Gastroenterol Clin Biol** 1982 Feb;6(2):166-9 (Eng. Abstr.) **(Fre)**

[Behavior of secretin-pancreozymin-stimulated pancreatic secretion, gallbladder contraction and choleresis after somatostatin administration] von Kleist D, et al. **Dtsch Z Verdau Stoffwechselkr** 1981; 41(5):219-24 (Eng. Abstr.) **(Ger)**

[The effect of chronic administration of somatostatin on the hemostatic system in the dog (author's transl)] Gabryelewicz A, et al. **Przegl Lek** 1981;38(10):719-21 (Eng. Abstr.) **(Pol)**

[Effect of somatostatin on pancreatic secretion in the dog] Fokina AA, et al. **Fiziol Zh SSSR** 1981 Nov;67(11):1737-9 **(Rus)**

SOMATOTROPIN RELEASING HORMONE

Evidence that reduced growth hormone secretion observed in monosodium glutamate-treated rats is the result of a deficiency in growth hormone-releasing factor. Millard WJ, et al. **Endocrinology** 1982 Feb;110(2):540-50

Growth hormone releasing activity persists in the deafferented medial-basal hypothalamus of the rat. Antoni FA, et al. **J Endocrinol** 1981 Dec;91(3):415-25

STARTLE REACTION

Spinal modulation of acoustic startle: opposite effects of clonidine and d-amphetamine. Davis M, et al. **Psychopharmacology (Berlin)** 1981; 75(3):219–25

STEREOTYPED BEHAVIOR

Study of the neural basis of circling behavior induced by L-dopa in lesioned entopeduncular cats. Pazo JH, et al. **Brain Res** 1982 Feb 11; 233(2):337–45

Opposed stages of continuous amphetamine administration: parallel alterations in motor stereotypies and in vivo spiroperidol accumulation. Ellison G, et al. **Eur J Pharmacol** 1981 Sep 11;74(2–3):207–14

Behavioural evidence for supersensitivity of postsynaptic dopamine receptors in the mesolimbic system after chronic administration of desipramine. Spyraki C, et al. **Eur J Pharmacol** 1981 Sep 11; 74(2–3):195–206

The chronic effect of nomifensine on rat stereotyped behavior. Muto K, et al. **Kurume Med J** 1981;28(2):173–5

The methylphenidate-induced stereotypy in the awake rat: local cerebral metabolism. Bell RD, et al. **Neurology (NY)** 1982 Apr;32(4):377–81

Further evidence for a GABA-like action on kojic amine. Martin GE, et al. **Neurosci Lett** 1981 Nov 18;27(1):37–40

Gnawing and changes in reactivity produced by microinjections of picrotoxin into the superior colliculus of rats. Redgrave P, et al. **Psychopharmacology (Berlin)** 1981;75(2):198–203

[Effect of alpha-methyl-para-tyrosine on 'methamphetamine-induced sterotype and hypermotility' of reserpinized rats (author's transl)] Nakajima H, et al. **Nippon Yakurigaku Zasshi** 1981 Dec;78(6):557–69 (Eng. Abstr.) **(Jpn)**

[Effect of phenamine and haloperidol on stereotyped behavior in response to electric stimulation of the substantia nigra in cats] Arushanian EB, et al. **Biull Eksp Biol Med** 1981 Oct;91(10):444–7 (Eng. Abstr.) **(Rus)**

[Effect of amizil and galantamin on the behavioral effects of apomorphine in rats] Bandman AL, et al. **Biull Eksp Biol Med** 1981 Nov; 92(11):566–9 (Eng. Abstr.) **(Rus)**

[Comparison of clebopride, domperidone, metopimazine, and trimebutine as antiemetics and inducers of gastrointestinal peristalsis] Berga P, et al. **Arch Farmacol Toxicol** 1981 Apr;7(1):189–92 **(Spa)**

[Effect of N-(4-picolyl)-3,5 dimethylbenzamide (M-14012-4) on stereotyped behavior induced by apomorphine and amphetamine in the rat and mouse] Casais PL, et al. **Arch Farmacol Toxicol** 1981 Apr; 7(1):65–72 **(Spa)**

STRESS, PSYCHOLOGICAL

Effect of noise on blood pressure and 'stress' hormones. Andrén L, et al. **Clin Sci** 1982 Feb;62(2):137–41

Stress-modulated alteration of brain biogenic amines in the rat: effects of L-tryptophan. Quirce CM, et al. **Commun Psychopharmacol** 1980; 4(5):371–7

Effect of immobilization stress & ascorbic acid on acetylcholine & plasma cortisol in albino rats. Gode JD, et al. **Indian J Exp Biol** 1981 Dec; 19(12):1175–6

The effects of age on the plasma catecholamine response to mental stress in man. Barnes RF, et al. **J Clin Endocrinol Metab** 1982 Jan; 54(1):64–9

Interaction of apomorphine and stressors in the production of hyperthermia in the rabbit. Snow AE, et al. **J Pharmacol Exp Ther** 1982 Feb;220(2):335–9

[Dynamics of noradrenaline concentration in the hepatic portal vein and atria of rats during stress] Manukhina EB, et al. **Biull Eksp Biol Med** 1981 Dec;92(12):673–4 (Eng. Abstr.) **(Rus)**

[Changes in the catecholamine content in adrenaline-synthetizing structures of the medulla oblongata in rats with different reactions to long-term immobilization] Kvetnanskil R, et al. **Probl Endokrinol (Mosk)** 1981;27(6):58–63 (Eng. Abstr.) **(Rus)**

[Psychological component of human stress (author's transl)] Vargas Fernández L. **Rev Med Chil** 1981 May;109(5):441–51 (Eng. Abstr.) **(Spa)**

SUBSTANCE P

In vitro degradation of substance P: new rapid assay and distribution in rat brain. Akopyan TN, et al. **Acta Biol Med Ger** 1981; 40(6):779–84

Depletion of primary afferent substance P by capsaicin and dihydrocapsaicin without altered thermal sensitivity in rats. Buck SH, et al. **Brain Res** 1982 Feb 4;233(1):216–20

Immunoreactive substance P in the substantia nigra of the monkey: light and electron microscopic localization. DiFiglia M, et al. **Brain Res** 1982 Feb 11;233(2):381–8

Inner plexiform circuits in the carp retina: effects of cholinergic agonists, GABA, and substance P on the ganglion cells. Glickman RD, et al. **Brain Res** 1982 Feb 18;234(1):81–99

Synthesis, and central and peripheral axonal transport of substance P in a dorsal root ganglion-nerve preparation in vitro. Harmar A, et al. **Brain Res** 1982 Jan 14;231(2):379–85

Effect of spinal ganglionectomy on substance P-like immunoreactivity in the gastroduodenal tract of cats. Hayashi H, et al. **Brain Res** 1982 Jan 28;232(1):227–30

Regulation of substance P in adult rat sympathetic ganglia. Kessler JA, et al. **Brain Res** 1982 Feb 18;234(1):182–7

The actions of neuropeptides on dorsal horn neurons in the rat spinal cord slice preparation: an intracellular study. Murase K, et al. **Brain Res** 1982 Feb 18;234(1):170–6

Dual effects of substance P on the excitability of single cutaneous primary afferent C- and A-fibers in the cat spinal cord. Randić M, et al. **Brain Res** 1982 Feb 11;233(2):389–93

Evidence for the existence of a substance P-containing pathway from the nucleus laterodorsalis tegmenti (Castaldi) to the lateral septal area of the rat. Sakanaka M, et al. **Brain Res** 1981 Dec 28; 230(1–2):351–5

Spinal neurons mediate return of substance P following deafferentation of cat spinal cord. Tessler A, et al. **Brain Res** 1981 Dec 28; 230(1–2):263–81

Distribution of neuropeptides in the dorsal pontine tegmental area of the rat. Matsuzaki T, et al. **Cell Mol Biol** 1981;27(5):499–508

Substance P-immunoreactive nerve fibres in the anterior segment of the rabbit eye. Distribution and possible physiological significance. Tornqvist K, et al. **Cell Tissue Res** 1982;222(3):467–77

Substance P immunoreactivity in the anterior pituitary gland of the guinea pig. DePalatis LR, et al. **Endocrinology** 1982 Jan;110(1):282–4

Antagonists of substance P. Caranikas S, et al. **Eur J Pharmacol** 1982 Jan;77(2–3):205–6

The effects of 5-hydroxytryptamine-depleting drugs on peptides in the ventral spinal cord. Gilbert RF, et al. **Eur J Pharmacol** 1981 Dec 3; 76(2–3):203–10

Substance P, but not TRH, modulates the 5-HT autoreceptor in ventral lumbar spinal cord. Mitchell R, et al. **Eur J Pharmacol** 1981 Nov 19; 76(1):119–20

Synthesis and metabolic stability of a tritium-labelled substance P analogue. Sandberg BE, et al. **FEBS Lett** 1982 Jan 25;137(2):236–40

Localization of substance P-like immunoreactivity in the anterior eye segment of squirrels: an immunohistochemical analysis. Shimizu Y, et al. **Invest Ophthalmol Vis Sci** 1982 Feb;22(2):259–63

Substance P-like immunoreactivity in the intramural nerve plexuses of the guinea-pig ureter: a light and electron microscopical study. Sikri KL, et al. **J Anat** 1981 Oct;133(Pt 3):425–42

Perivascular substance P: occurrence and distribution in mammalian pial vessels. Uddman R, et al. **J Cereb Blood Flow Metab** 1981; 1(2):227–32

Localization of methionine-enkephalin, substance P, and somatostatin immunoreactivities in the main olfactory bulb of the hamster. Davis BJ, et al. **J Comp Neurol** 1982 Feb 1;204(4):377–83

Serotonin and gamma-aminobutyric acid turnover after injection into the median raphe of substance P and D-ala-met-enkephalin amide. Forchetti CM, et al. **J Neurochem** 1982 May;38(5):1336–41

Active uptake of substance P carboxy-terminal heptapeptide (5–11) into rat brain and rabbit spinal cord slices. Nakata Y, et al. **J Neurochem** 1981 Dec;37(6):1529–34

Enzyme-linked immunosorbent assay of substance P: a study in the eye. Stjernschantz J, et al. **J Neurochem** 1982 May;38(5):1323–8

Substance P-like immunoreactivity in neurons in dissociated cell cultures of mammalian spinal cord and dorsal root ganglia. Neale EA, et al. **J Neurosci** 1982 Feb;2(2):169–77

Neurohumoral control of ileal electrolyte transport. II. Neurotensin and substance P. Kachur JF, et al. **J Pharmacol Exp Ther** 1982 Mar; 220(3):456–63

Substance P: immunohistochemical localization and effect upon cat pial arteries in vitro and in situ. Edvinsson L, et al. **J Physiol (Lond)** 1981 Sep;318:251–8

Mediators of slow synaptic potentials in the myenteric plexus of the guinea-pig ileum. Johnson SM, et al. **J Physiol (Lond)** 1981 Nov; 320:175–86

Noncholinergic, nonadrenergic contraction and substance P in rabbit iris sphincter muscle. Ueda N, et al. **Jpn J Pharmacol** 1981 Dec; 31(6):1071–9

Age-related changes in central nervous system enkephalins and substance P. Dupont A, et al. **Life Sci** 1981 Nov 30;29(22):2317–22

Biological activity of substance P methyl ester. Cascieri MA, et al. **Mol Pharmacol** 1981 Nov;20(3):457–9

Co-occurrence of substance P-like and Leu-enkephalin-like immunoreactivities in neurones and fibres of avian nervous system. Erichsen JT, et al. **Nature** 1982 Feb 4;295(5848):407–10

Fifty years of substance P [news] Jessell TM. **Nature** 1982 Feb 18; 295(5850):551–3

A survey of substance P, somatostatin, and neurotensin levels in aging in the rat and human central nervous system. Buck SH, et al. **Neurobiol Aging** 1981 Winter;2(4):257–64

The role of the N-terminal tetrapeptide in the histamine releasing action of substance P. Mazurek N, et al. **Neuropharmacology** 1981 Nov;

20(11):1025-7

Substance P decreases membrane conductance in neurons of the guinea pig hypothalamus in vitro. Ogata N, et al. **Neuropharmacology** 1982 Feb;21(2):187-9

Developmental changes in bombesin, substance P, somatostatin and vasoactive intestinal polypeptide in the rat brain. McGregor GP, et al. **Neurosci Lett** 1982 Jan 22;28(1):21-7

Localization of substance P-like immunoreactivity in cell bodies of the feline dorsal vagal nucleus. Maley B, et al. **Neurosci Lett** 1981 Dec 11;27(2):187-91

Depletion by capsaicin of substance P-immunoreactivity and acetylcholinesterase activity from nerve fibres in the guinea-pig heart. Papka RE, et al. **Neurosci Lett** 1981 Nov 18;27(1):47-53

Transplantation of irides or sensory ganglia to the anterior eye chamber of the rat: survival and sprouting of substance P-containing neurones. Skagerberg G, et al. **Neurosci Lett** 1982 Jan 22;28(1):29-34

Coexistence of substance P- and cholecystokinin-like immunoreactivity in neurons of the mesencephalic periaqueductal central gray. Skirboll L, et al. **Neurosci Lett** 1982 Jan 22;28(1):35-9

Peptidergic innervation of the mammalian sinus nodes: vasoactive intestinal polypeptide, neurotensin, substance P. Weihe E, et al. **Neurosci Lett** 1981 Nov 4;26(3):283-8

Localization of substance P-like immunoreactivity in the adult and developing goldfish retina. Brecha N, et al. **Neuroscience** 1981; 6(12):2737-46

Thermal analgesia and substance P depletion induced by capsaicin in guinea-pigs. Buck SH, et al. **Neuroscience** 1981;6(11):2217-22

The distribution of substrate P-like immunoreactive nerves in the guinea-pig heart. Wharton J, et al. **Neuroscience** 1981;6(11):2193-204

Mini review: smooth muscle pharmacology of substance P. Couture R, et al. **Pharmacology** 1982 Jan;24(1):1-25 (66 ref.)

Substance P levels in the rat forebrain after apomorphine and haloperidol treatment. Janicki P, et al. **Pol J Pharmacol Pharm** 1981; 33(5):499-502

[Duration of the normalizing effect of substance P in disturbances of the learning process after long-term exposure to noise] Hecht K, et al. **Pharmazie** 1981 Dec;36(12):859-60 **(Ger)**

[Neuropeptides in the rabbit eye. I. RIA for beta-endorphin, substance P and neurotensin in the aqueous humor, iris-ciliary body and retina (author's transl)] Baba S, et al. **Nippon Ganka Gakkai Zasshi** 1981 Sep 10;85(9):1267-72 (Eng. Abstr.) **(Jpn)**

[Effect of substance P on the mesenteric microcirculation system] Gorizontova MP, et al. **Biull Eksp Biol Med** 1981 Nov;92(11):515-7 (Eng. Abstr.) **(Rus)**

SYMPATHOMIMETICS

Effect of sympathomimetic substances and analogues on tail absorption of frog larva. Csaba G, et al. **Acta Biol Acad Sci Hung** 1981; 32(2):103-9

Suppression of mammotropic development and prolactin release by sympathomimetic drugs in rats. Shani J, et al. **Arch Farmacol Toxicol** 1981 Aug;7(2):201-8

Response of the isolated rabbit ciliary epithelium to adrenergic drugs following superior cervical ganglionectomy. Green K, et al. **Curr Eye Res** 1981;1(4):217-22

Effects of adrenergic drugs on raphe unit activity in freely moving cats. Heym J, et al. **Eur J Pharmacol** 1981 Sep 11;74(2-3):117-25

Effects of adrenergic drugs on miniature contractions of isolated dog urinary bladder. Ueda S, et al. **Eur Urol** 1982 Jan-Feb;8(1):37-41

Effects of parasympathomimetic and sympathomimetic drugs on the secretion and composition of rat sublingual saliva. Abe K, et al. **J Dent Res** 1982 Jan;61(1):52-6

Effects of intraventricular administration of sympathomimetic agents on metabolic, vasomotor and temperature responses in Taiwan monkeys. Chern YF, et al. **Jpn J Physiol** 1981;31(4):599-603

Development of stimulus-secretion coupling in salivary glands. Cutler LS, et al. **Methods Cell Biol** 1981;23:531-45

Shock demands drugs--but which one's best for your patient? Barrows JJ. **Nursing (Horsham)** 1982 Feb;12(2):34-41

SYNAPTIC RECEPTORS

Stereoselectivity of presynaptic autoreceptors modulating dopamine release. Arbilla S, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):345-51

Affinity of thiocolchicoside and thiocolchicoside analogues for the postsynaptic GABA receptor site. Biziere K, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):167-8

Endogenous GABA determines the characteristics of [3H]GABA-binding. Gardner CR, et al. **Eur J Pharmacol** 1981 Oct 22;75(2-3):83-92

Inhibition of [3H]GABA binding to postsynaptic receptors in human cerebellar synaptic membranes by carboxyl and amino derivatives of GABA. Breckenridge RJ, et al. **J Neurochem** 1981 Oct;37(4):837-44

Molecular interactions of etazolate with benzodiazepine and picrotoxinin binding sites. Ticku MK, et al. **J Neurochem** 1982 Apr;38(4):1180-2

Benzodizepines: biochemistry of function. Tallman JF. **Natl Inst Drug Abuse Res Monogr Ser** 1980;(33):4-11

Molecular size of benzodiazepine receptor in rat brain in situ: evidence for a functional dimer? Doble A, et al. **Nature** 1982 Feb 11; 295(5849):522-3

Non-dopaminergic fibres may regulate dopamine-sensitive adenylate cyclase in the prefrontal cortex and nucleus accumbens. Tassin JP, et al. **Nature** 1982 Feb 25;295(5851):696-8

Effect of lithium on circadian neurotransmitter receptor rhythms. Kafka MS, et al. **Neuropsychobiology** 1982 Jan-Feb;8(1):41-50

6 -Hydroxydopamine decreases benzodiazepine but not GABA receptor binding in rat cerebellum. Doble A, et al. **Neurosci Lett** 1981 Dec 11; 27(2):199-204

Changes in rat hippocampal benzodiazepine receptors and lack of changes in muscarinic receptors after fimbria-fornix lesions. Sábato UC, et al. **Neurosci Lett** 1981 Dec 11;27(2):193-7

Different synaptic location of mianserin and imipramine binding sites. Brunello N, et al. **Science** 1982 Feb 26;215(4536):1112-5

TESTOSTERONE

Responses of ram lambs to active immunization against testosterone and luteinizing hormone-releasing hormone. Schanbacher BD. **Am J Physiol** 1982 Mar;242(3):E201-5

Temporal relationship between the development of the self-priming effect of LHRH and changes in serum concentrations of testosterone and androstenedione during the sexual maturation of the male rat. Nazian SJ. **Biol Reprod** 1981 Dec;25(5):977-82

Induction of testicular gonadotropin-releasing hormone (GnRH) receptors by GnRH: effects of pituitary hormones and relationship to inhibition of testosterone production. Bourne GA, et al. **Endocrinology** 1982 Mar;110(3):727-33

Pituitary receptor sites for gonadotropin-releasing hormone: effect of castration and substitutive therapy with sex steroids in the male rat. Conne BS, et al. **Endocrinology** 1982 Jan;110(1):70-9

Effect of unilateral castration and unilateral cryptorchidism on gonadotropin and testosterone response to gonadotropin releasing hormone in the bull. Barnes MA, et al. **J Anim Sci** 1981 Nov; 53(5):1341-50

Sexual differentiation of hepatic metabolism of corticosterone and testosterone in the rat. Rahman R, et al. **J Biochem (Tokyo)** 1981 Dec; 90(6):1567-75

Plasma LH and testosterone responses to synthetic gonadotrophin-releasing hormone (GnRH) or dexamethasone-GnRH combined treatment and their relationship to semen output in bulls. Abdel Malak G, et al. **J Reprod Fertil** 1982 Jan;64(1):107-13

Comparison of steroid and LH-RH effects on the responsiveness of hemipituitary glands and dispersed pituitary cells. Speight A, et al. **Mol Cell Endocrinol** 1981 Dec;24(3):267-81

Dissociation of the effects of gonadal steroids on brain serotonin metabolism and sexual behavior in the male rat. Bradshaw WG, et al. **Neuroendocrinology** 1982 Jan;34(1):38-45

Serum testosterone concentrations during the 4-day estrous cycle in normal and adrenalectomized rats. Rush ME, et al. **Proc Soc Exp Biol Med** 1982 Feb;169(2):216-21

[A factor influencing in vitro the influx of 86Rb+ into erythrocytes as an impurity of a commercial preparation of testosterone (author's transl)] Schreiber V, et al. **Sb Lek** 1981;83(11-12):305-8 (Eng. Abstr.) **(Cze)**

[Studies on the feedback regulation of gonadotropin concentrations in male rats (I). The effects of hypothalamic implantation of testosterone and its metabolites on gonadotropin release in castrated male rats (author's transl)] Noguchi K. **Nippon Naibunpi Gakkai Zasshi** 1981 Aug 20;57(8):1139-47 (Eng. Abstr.) **(Jpn)**

[Changes in the blood level of certain hormones of immature rats after thermal burn] Kamilov FKh, et al. **Vopr Med Khim** 1982 Jan-Feb; 28(1):56-9 (Eng. Abstr.) **(Rus)**

THINKING

The flow of thought and the flow of substance in the brain. McIlwain H. **Biol Psychol** 1981 Mar-May;12(2-3):147-69

THIORIDAZINE

Disparate serum thioridazine concentrations: liquid chromatography versus radioreceptor assay. Linnoila M, et al. **Acta Pharmacol Toxicol (Copenh)** 1982 Jan;50(1):25-9

[Comparison of the effectiveness of tranylcypromine, nortriptyline, thioridazine and amitriptyline in two syndromological types of endogenous depression (author's transl)] Náhunek K, et al. **Cesk Psychiatr** 1981;77(4):245-52 (Eng. Abstr.) **(Cze)**

THIOTHIXENE

Serum level monitoring of thiothixene in schizophrenia: acute single-dose levels at fixed doses. Yesavage JA, et al. **Am J Psychiatry** 1982 Feb; 139(2):174-8

THIRST

Anygdalar noradrenergic and dopaminergic mechanisms in the regulation of hunger and thirst-motivated behavior. Lénárd L, et al. **Brain Res** 1982 Feb 4;233(1):115–32

THYROID HORMONES

Differences in the binding of thyroid hormones and indoles by rat alpha 1-fetoprotein and serum albumin. Hervé F, et al. **Eur J Biochem** 1982 Mar 1;122(3):609–12

The effect of antipyrine, phenobarbitol and rifampicin on thyroid hormone metabolism in man. Ohnhaus EE, et al. **Eur J Clin Invest** 1981 Oct; 11(5):381–7

Acute thyroid hormone increases noradrenergic responsiveness of rat atria in vitro. Eiden LE, et al. **Eur J Pharmacol** 1981 Aug 27;74(1):91–3

Thyroid proliferation, body weight, thyrotropin and thyroid hormones in chronic antithyroid (carbimazole) treatment in rats. Redmond O, et al. **J Anat** 1981 Aug;133(Pt 1):37–47

The effects of aging on thyroid hormone economy in man. Ingbar SH. **Prog Clin Biol Res** 1981;74:135–45 (42 ref.)

An inhibitor of the binding of thyroid hormones to serum proteins is present in extrathyroidal tissues. Chopra IJ, et al. **Science** 1982 Jan 22; 215(4531):407–9

[Age and changes in thyroid function and tissue metabolism of its hormones] Iasenchak SA, et al. **Fiziol Zh** 1982 Jan–Feb;28(1):25–9 **(Rus)**

[Effect of thyroid hormones on various indices of water–electrolyte and kidney function in rats] Mostovoi VS. **Fiziol Zh** 1981 Nov–Dec; 27(6):826–9 **(Rus)**

[Isoenzymatic spectra of lactate dehydrogenase in various areas of the rat brain and the influence of thyroidin on them] Kononenko VIa, et al. **Ukr Biokhim Zh** 1982;54(1):26–30 (Eng. Abstr.) **(Rus)**

[Changes in the blood level of certain hormones of immature rats after thermal burn] Kamilov FKh, et al. **Vopr Med Khim** 1982 Jan–Feb; 28(1):56–9 (Eng. Abstr.) **(Rus)**

[Effect of heparin on thyroid function indicators as determined by radioanalysis] Košlík S, et al. **Vnitr Lek** 1982 Feb;28(2):122–8 (Eng. Abstr.) **(Slo)**

THYROTROPIN

Studies on the mechanism of the GABAergic inhibition of TSH secretion in male rats. Mattila J. **Acta Pharmacol Toxicol (Copenh)** 1981 Apr; 48(4):320–5

Persistent elevation of thyroid-stimulating hormone in women with bipolar affective disorder. O'Shanick GJ, et al. **Am J Psychiatry** 1982 Apr;139(4):513–4

Effect of domperidone on prolactin (PRL)and thyrotrophin (TSH) secretion. Kaufman JM, et al. **Arch Int Pharmacodyn Ther** 1981 Dec; 254(2):293–303

Large single doses of oral TRH blockade the TSH response in children. Villalpando-Hernández S, et al. **Arch Invest Med (Mex)** 1981; 12(4):491–7 **(Eng, Spa)**

The extracerebral dopamine antagonist domperidone block the suppressive effect of bromocriptine on prolactin and TSH secretion in man. Švet-Moldavsky I, et al. **Biomedicine** 1981 Oct;35(5):142–4

Differential effects of pharmacological manipulations of central alpha 1- and alpha 2-adrenergic receptors on the secretion of thyrotropin and growth hormone in male rats. Krulich L, et al. **Endocrinology** 1982 Mar;110(3):796–804

Involvement of alpha 1-adrenergic receptors in the inhibitory effect of catecholamines on the thyrotropin-induced release of thyroxine by the mouse thyroid. Muraki T, et al. **Endocrinology** 1982 Jan;110(1):51–4

Influence of endogenous somatostatin on growth hormone and thyrotropin secretion in neonatal rats. Oliver C, et al. **Endocrinology** 1982 Mar; 110(3):1018–22

Possible involvement of nigrostriatal dopamine system in the inhibition of thyrotropin secretion in the rat. Männistö P, et al. **Eur J Pharmacol** 1981 Dec 17;76(4):403–9

Plasma triiodothyronine response to thyrotropin releasing hormone, thyrotropin and propranolol in old age. Szabolcs I, et al. **Exp Gerontol** 1981;16(4):309–16

Thyroid proliferation, body weight, thyrotropin and thyroid hormones in chronic antithyroid (carbimazole) treatment in rats. Redmond O, et al. **J Anat** 1981 Aug;133(Pt 1):37–47

The effect of TRH and its analogues, (Pro-NH-NH2)3TRH and (2-Picolyl)1-TRH on TSH level in rat serum. Ryżewska M, et al. **Mater Med Pol** 1980 Jan–Jun;12(1–2):136–9

[Effects of cyproheptadine on the secretion and pituitary content of thyrotropin in rats] Ulloa ER, et al. **Medicina (B Aires)** 1981; 41(3):333–6 (Eng. Abstr.) **(Spa)**

THYROXINE

Abnormal brown adipose tissue in genetically obese mice (ob/ob): effect of thyroxine. Hogan S, et al. **Am J Physiol** 1981 Dec; 241(6):E436–43

Thyroxine radioimmunoassay for population surveys using dried blood: modifications of a highly sensitive method. Obregón MJ. **Ann Clin Biochem** 1982 Jan;19(Pt 1):29–34

Treatment of intractable rapid-cycling manic-depressive disorder with levothyroxine. Clinical observations. Stancer HC, et al. **Arch Gen Psychiatry** 1982 Mar;39(3):311–2

Effects of thyroxine binding on the stability, conformation, and fluorescence properties of thyroxine-binding globulin. Grimaldi S, et al. **Biochemistry** 1982 Jan 5;21(1):145–51

Influence of growth hormone and thyroxine on thermotropic effects of respiration and 1-anilino-8-naphthalene sulfonate fluorescence and on lipid composition of cardiac membranes. Clejan S, et al. **Biochim Biophys Acta** 1981 Dec 4;678(2):250–6

Thyroxine-induced redistribution of isoenzymes of rabbit ventricular myosin. Martin AF, et al. **Circ Res** 1982 Jan;50(1):117–24

Enzyme immunoassay of thyroxin with a centrifugal analyzer. Izquierdo JM, et al. **Clin Chem** 1982 Jan;28(1):123–5

Covalent linkage of antisera to microparticulate cellulose using 1,1'-carbonyldiimidazole: a rapid, practical method with potential use in solid-phase immunoassay. Chapman RS, et al. **Clin Chim Acta** 1982 Jan 5;118(1):129–34

Insulin binding and response to insulin of adipocytes from thyroxine-treated rats. Heise E, et al. **Endocrinology** 1982 Mar; 110(3):955–60

Involvement of alpha 1-adrenergic receptors in the inhibitory effect of catecholamines on the thyrotropin-induced release of thyroxine by the mouse thyroid. Muraki T, et al. **Endocrinology** 1982 Jan;110(1):51–4

Regulation of mouse submaxillary gland renin by thyroxine. Wilson CM, et al. **Endocrinology** 1982 Mar;110(3):982–9

Lack of effect of cortisone, thyroxine and insulin on the developmental pattern of mouse intestinal glucose-6-phosphatase activity. Ménard D, et al. **Experientia** 1982 Jan 15;38(1):111–2

Seasonal plasma T4 titers in the hibernating lizard Cnemidophorus sexlineatus. Sellers JC, et al. **Gen Comp Endocrinol** 1982 Jan; 46(1):24–8

Direct and correlated responses to selection for plasma thyroxine levels in mice. Tilakaratne N, et al. **Genet Res** 1981 Oct;38(2):157–69

Early changes in brush border disaccharidase kinetics in rat jejunum following subcutaneous administration of tetraiodothyronine: a quantitative histochemical study on villi revealing normal morphology. Gutschmidt S, et al. **Histochemistry** 1981;73(1):151–60

Comparison of eleven commercially available kits for the radioimmunoassay of serum thyroxine. Elvers LH, et al. **J Clin Chem Clin Biochem** 1981 Jul;19(7):453–6

Increased immunological efficiency in young mice by short-term treatment with L-thyroxine. Basso A, et al. **J Endocrinol Invest** 1981 Oct–Dec;4(4):431–8

Inhibition of rat hepatic thyroxine 5'-monodeiodinase by propylthiouracil: relation to site of interaction of thyroxine and glutathione. Yamada T, et al. **J Endocrinol Invest** 1981 Oct–Dec;4(4):379–87

Ontogenesis of monoamine-synthesizing enzyme activities and biopterin levels in rat brain or salivary glands, and the effects of thyroxine administration. Kato T, et al. **J Neurochem** 1982 Apr;38(4):896–901

Neonatal hormone treatment and maturation of the pineal noradrenergic system: hydrocortisone and thyroxine. Yuwiler A, et al. **J Neurochem** 1981 Oct;37(4):985–92

Membrane immunoassay: a spin membrane immunoassay for thyroxine. Tan CT, et al. **Methods Enzymol** 1981;74 Pt C:152–61

Developmental changes in the activities of prolinase and prolidase in rat salivary glands, and the effect of thyroxine administration. Imai K, et al. **Mol Cell Biochem** 1982 Jan 16;42(1):31–6

Thyroxine only on Sundays [letter] Belton CH. **NZ Med J** 1981 Dec 23;94(698):470

Digoxin-like immunoreactivity of certain steroid and other hormones. Schreiber V, et al. **Physiol Bohemoslov** 1981;30(6):569–71

Interaction of thyroxine with lysozyme. Kramer KJ, et al. **Physiol Chem Phys** 1981;13(4):313–7

In vivo thyroxine release in day-old cockerels in response to acute stimulation by mammalian and avian pituitary hormones. MacKenzie DS. **Poult Sci** 1981 Sep;60(9):2136–43

Effect of high ambient temperature (35 degrees), and feed intake on plasma T4 levels in sheep. Valtorta S, et al. **Proc Soc Exp Biol Med** 1982 Feb; 169(2):260–5

An inhibitor of the binding of thyroid hormones to serum proteins is present in extrathyroidal tissues. Chopra IJ, et al. **Science** 1982 Jan 22; 215(4531):407–9

[Plasma T4: adaptation of a commercial radioimmunoassay for use in dogs] Garnier F, et al. **Ann Biol Clin (Paris)** 1981;39(6):369–70 **(Fre)**

[Basic and clinical evaluation of the method of free thyroxine levels in serum with radioimmunoassay (author's transl)] Masuoka T, et al. **Horumon To Rinsho** 1981 Aug;29(8):1025–9 **(Jpn)**

[Measurement of free thyroxine in serum using 'SPAC-T4' RIA kit (author's transl)] Usami H, et al. **Horumon To Rinsho** 1981 Sep; 29(9):1167–72 **(Jpn)**

[Radioimmunoassay of free thyroxine with microencapsulated anti-T4 specific antibody (author's transl)] Kasagi K, et al. **Kaku Igaku** 1981 Aug;18(7):973–83 **(Jpn)**

TRANQUILIZING AGENTS

Anxiety and other neurotic symptoms in patients suffering from dans la conception des états limitrophes et des mécanismes d'action clinique des tranquillisants. Skovronsky O, et al. **Agressologie** 1981 Oct; 22(C):25–6

Adverse reactions to benzodiazepine-tricyclic antidepressant compound. Beresford TP, et al. **J Clin Psychopharmacol** 1981 Nov;1(6):392–4

[New trends in the concept of border states and mechanisms of clinical action of tranquilizers] Alexandrovsky YA. **Agressologie** 1981 Oct; 22(C):19–24 **(Fre)**

[Hemorheological substantiation of transfusion therapy in acute exogenous poisoning] Kostin GM, et al. **Probl Gematol Pereliv Krovi** 1981 Oct; 26(10):37–41 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MAJOR

Fluphenazine and flupenthixol decanoate in psychiatric outpatients practice. Coufal J, et al. **Act Nerv Super (Praha)** 1981;23(4):269–71

Further clinical experience with oxyprothepin–decanoate. Kalvach Z, et al. **Act Nerv Super (Praha)** 1981;23(4):271–2

Effects of lithium and neuroleptics and combinations of the two on renal function and structure in rats. Christensen S, et al. **Acta Pharmacol Toxicol (Copenh)** 1981 Sep;49(3):161–7

Anxiolytic properties of neuroleptic drugs. Balon R, et al. **Agressologie** 1981 Nov;22(D):9–10

Treatment of anxious depression with intravenous infusions of a combination of drugs. Krebs–Roubicek E, et al. **Agressologie** 1981 Nov; 22(D):25–6

Neuroleptics in the treatment of anxiety. Schmidt P. **Agressologie** 1981 Nov;22(D):19–20

Urinary incontinence and neuroleptics [letter] Ambrosini PJ, et al. **Am J Psychiatry** 1982 Apr;139(4):539

Stimulated lymphocytes in schizophrenia. Hirata–Hibi M, et al. **Arch Gen Psychiatry** 1982 Jan;39(1):82–7

Brain histamine H1– and H2–receptors and histamine–sensitive adenylate cyclase: effects of antipsychotics and antidepressants. Coupet J, et al. **Eur J Pharmacol** 1981 Sep 11;74(2–3):149–55

Hypophysectomy does not prevent development of striatal dopamine receptor supersensitivity induced by repeated neuroleptic treatment. Jenner P, et al. **Eur J Pharmacol** 1981 Nov 19;76(1):31–6

Des–tyr–gamma–endorphin (DT gamma E) and pineal levels of melatonin and arginine vasopressin (AVP). King MG, et al. **Eur J Pharmacol** 1981 Dec 3;76(2–3):271–4

Possible use of non–neuroleptic isomers of anti–psychotics in anti–sickling therapy. Ohnishi ST, et al. **Eur J Pharmacol** 1981 Oct 22; 75(2–3):121–5

Comparative effects of short– and long–term treatment with neuroleptics on behavioural activity as well as dopamine turnover in striatum. Rastogi RB, et al. **Gen Pharmacol** 1982;13(1):35–40

The treatment of refractory schizophrenia: pharmacotherapy and clinical implications of blood level measurement of neuroleptics. Pi EH, et al. **Int Pharmacopsychiatry** 1981;16(3):154–61

Antipsychotic drugs and the noninstitutionalized patient: a leap into the future or the past? Fried JM. **J Clin Psychopharmacol** 1981 Sep; 1(5):323–5

How capable of driving are hospitalized psychiatric patients under psycho–active drug therapy? Hobi V, et al. **J Int Med Res** 1981; 9(6):434–47

Effects of neuroleptic drugs on endogenous opioid peptides in the rat. Höllt V. **Mod Probl Pharmacopsychiatry** 1981;17:1–18

Neuroleptic–like and antipsychotic effects of gamma–type endorphins. Van Ree JM, et al. **Mod Probl Pharmacopsychiatry** 1981;17:266–78

Neuroleptic malignant syndrome caused by dopamine depleting drugs [letter] Login IS, et al. **Neurology (NY)** 1982 Feb;32(2):218–9

Site–specific blockade of dopamine receptors by neuroleptic agents in human brain. Borison RL, et al. **Neuropharmacology** 1981 Dec; 20(12B):1321–2

Pharmacokinetic aspects of new antipsychotic drugs. Dahl SG. **Neuropharmacology** 1981 Dec;20(12B):1299–302

Substituted benzamide drugs as selective neuroleptic agents. Jenner P, et al. **Neuropharmacology** 1981 Dec;20(12B):1285–93

Pharmacological properties of new antipsychotic agents: use of animal models. Puech AJ, et al. **Neuropharmacology** 1981 Dec; 20(12B):1279–84

Neuroleptics as antidepressants. Robertson MM, et al. **Neuropharmacology** 1981 Dec;20(12B):1335–6

Initial improvement as predictor of outcome of neuroleptic treatment. Nedopil N, et al. **Pharmacopsychiatria** 1981 Nov;14(6):205–7

Effect of neuroleptics on release on acetylcholine to the lateral cerebral ventricle in the rat. Plech A, et al. **Pol J Pharmacol Pharm** 1981; 33(4):393–400

Enhancement of the avoidance–suppressing effects of neuroleptic agents after repeated administration: changes in the discriminated avoidance response in rats. Kuribara H, et al. **Psychopharmacology (Berlin)** 1981; 75(2):148–51

Effect of single oral doses of various neuroleptic drugs on salivary secretion rate, pH, and buffer capacity in healthy subjects. Molander L, et al. **Psychopharmacology (Berlin)** 1981;75(2):114–8

Assessing pharmacologically induced dopamine receptor sensitivity changes with the Ungerstedt turning model. Siever L, et al. **Psychopharmacology (Berlin)** 1981;75(2):212–3

[Psychopharmacology and Research into Borderline states (author's transl)] Boleloucký Z, et al. **Cesk Psychiatr** 1981 Jun;77(3):148–52 (Eng. Abstr.) **(Cze)**

[Biologic therapy of schizophrenia] Lambert PA, et al. **Soins Psychiatr** 1981 Dec;(14):19–22 **(Fre)**

[Comparison between the effectiveness of fluphenazine decanoate and oxyprothepin decanoate in schizophrenia (double–blind crossover study)] Balon R, et al. **Zh Nevropatol Psikhiatr** 1982;82(1):116–8 (Eng. Abstr.) **(Rus)**

[Predicting the effect of psychopharmacotherapy in schizophrenic patients] Dikil NT. **Zh Nevropatol Psikhiatr** 1982;82(1):110–5 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MINOR

Anxiolytics and beta blockers: evaluation of pharmacodynamics by quantitative EEG, psychometric and physiological variables. Saletu B, et al. **Agressologie** 1981 Oct;22(C):5–16

Prescribing of minor tranquillizers for emotional problems in a family practice. Bass MJ, et al. **Can Med Assoc J** 1981 Dec 1; 125(11):1225–6

Adverse effects of antianxiety drugs. Edwards JG. **Drugs** 1981 Dec; 22(6):495–514 (83 ref.)

Use of stimulant/depressant drugs by drug abuse clients in selected metropolitan areas. Brown BS, et al. **Int J Addict** 1981 Dec; 16(8):1473–90

Determination of the anxiolytic agent 8–chloro–6–(2–chlorophenyl)–4H–imidazo–[1,5–alpha] [1,4]–benzodiazepine–3–carboxamide in whole blood, plasma or urine by high–performance liquid chromatography. Puglisi CV, et al. **J Chromatogr** 1981 Nov 13;226(1):135–46

Recent advances in anxiolytic therapy. Rickels K. **J Clin Psychiatry** 1981 Nov;42(11 Pt 2):40–4

Anxiolytic properties of opiates and endogenous opioid peptides and their relationship to the actions of benzodiazepines. Millan MJ, et al. **Mod Probl Pharmacopsychiatry** 1981;17:123–41

Effects of anxiolytic drugs on the catecholamine and DOPAC (3, 4–dihydroxyphenylacetic acid) levels in brain cortical areas and on corticosterone and prolactin secretion in rats subjected to stress. Fekete MI, et al. **Psychoneuroendocrinology** 1981;6(2):113–20

A water lick conflict paradigm using drug experienced rats. Petersen EN, et al. **Psychopharmacology (Berlin)** 1981;75(3):236–9

Minor tranquilizers: prescribing practices of primary physicians. Rittelmeyer LF Jr. **Psychosomatics** 1982 Jan;23(1):23–6

[Psychopharmacology of anxiety. 1] **Agressologie** 1981 Oct;22(C):1–53 **(Fre)**

[Are benzodiazepines anxiolytics or hypnotics?] Porot M, et al. **Ann Med Psychol (Paris)** 1981;139(8):915–9 **(Fre)**

TRANYLCYPROMINE

[Comparison of the effectiveness of tranylcypromine, nortriptyline, thioridazine and amitriptyline in two syndromological types of endogenous depression (author's transl)] Náhunek K, et al. **Cesk Psychiatr** 1981;77(4):245–52 (Eng. Abstr.) **(Cze)**

TRIFLUOPERAZINE

Cyclic nucleotide phosphodiesterase of rat pancreatic islets. Effects of Ca2+, calmodulin and trifluoperazine. Sugden MC, et al. **Biochem J** 1981 Aug 1;197(2):459–64

Effects of trifluoperazine on human neutrophil function. Smith RJ, et al. **Immunology** 1981 Dec;44(4):677–84

Trifluoperazine inhibits phagocytosis in a macrophagelike cultured cell line. Horwitz SB, et al. **J Cell Biol** 1981 Dec;91(3 Pt 1):798–802

GLC analysis of trifluoperazine in human plasma. Javaid JI, et al. **J Pharm Sci** 1982 Jan;71(1):63–6

Drug management in chronic schizophrenia. Tune LE, et al. **Johns Hopkins Med J** 1982 Jan;150(1):45–8

TRYPTAMINES

Comparison of the cardiovascular responses to intracerebroventricular administration of tryptamine, 5-hydroxytryptamine, tryptophan and 5-hydroxytryptophan in rats. Krstić MK, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):385-91

Correlation of inhibitory activity of tryptamine derivatives on serotonin uptake in thrombocyte with van der Waals volume. Gupta SP, et al. **Arzneimittelforsch** 1981;31(12):2053-5

Behavioral effects and physiological disposition of some beta-hydroxylated indoleamines in the rat. Gentile NT, et al. **Biol Psychiatry** 1982 Jan;17(1):109-13

N, N-Diisopropyltryptamine (DIPT) and 5-methoxy-N,N-diisopropyltryptamine (5-MeO-DIPT). Two orally active tryptamine analogs with CNS activity. Shulgin AT, et al. **Commun Psychopharmacol** 1980;4(5):363-9

Biosynthesis of some urinary trace amines in the rat and the human. Boulton AA, et al. **Res Commun Chem Pathol Pharmacol** 1981 Nov;34(2):295-310

TRYPTOPHAN

Effect of leucine on tryptophan metabolism [letter] Narasinga Rao BS, et al. **Am J Clin Nutr** 1982 Jan;35(1):178-80

Effect of tryptophan on transport properties of newborn rabbit jejunum. Cooke HJ, et al. **Am J Physiol** 1982 Apr;242(4):G308-12

Microdetermination of unbound tryptophan in plasma by a combination of ultrafiltration and high-performance liquid chromatography. Hijikata Y, et al. **Anal Biochem** 1981 Nov 15;118(1):10-6

Enrichment and high-performance liquid chromatography analysis of tryptophan metabolites in plasma. Morita I, et al. **Anal Biochem** 1981 Nov 15;118(1):142-6

New approach to tryptophan production by Escherichia coli: genetic manipulation of composite plasmids in vitro. Aiba S, et al. **Appl Environ Microbiol** 1982 Feb;43(2):289-97

The amino acid composition of secreted mouse prolactin, growth hormone, and hamster prolactin: the presence of one tryptophan in mouse prolactin. Colosi P, et al. **Arch Biochem Biophys** 1981 Dec;212(2):759-61

Comparison of the cardiovascular responses to intracerebroventricular administration of tryptamine, 5-hydroxytryptamine, tryptophan and 5-hydroxytryptophan in rats. Krstić MK, et al. **Arch Int Physiol Biochim** 1981 Nov;89(4):385-91

Quantitative autoradiographic study of tryptophane movement in guinea-pig submandibular glands. Matthews RW, et al. **Arch Oral Biol** 1981;26(11):911-4

Tryptophan pyrrolase in haem regulation. The mechanism of the opposite effects of tryptophan on rat liver 5-aminolaevulinate synthase activity and the haem saturation of tryptophan pyrrolase. Badawy AA, et al. **Biochem J** 1981 Aug 15;198(2):309-14

Measurement of urinary tryptophan metabolites by reverse-phase high-pressure liquid chromatography. Tarr JB. **Biochem Med** 1981 Dec;26(3):330-8

Chemical cleavage of tryptophanyl and tyrosyl peptide bonds via oxidative halogenation mediated by o-iodosobenzoic acid. Fontana A, et al. **Biochemistry** 1981 Nov 24;20(24):6997-7004

Quenching of enzyme-generated acetone phosphorescence by indole compounds: stereospecific effects of D- and L-tryptophan. Photochemical-like effects. Rivas-Suárez E, et al. **Biochemistry** 1981 Dec 22;20(26):7329-33

Interaction of tryptophan-modified analogues of cholecystokinin-octapeptide with cholecystokinin receptors on pancreatic acini. Adachi H, et al. **Biochim Biophys Acta** 1981 Dec 18;678(3):358-63

Tryptophan fluorescence of human hemoglobin. II. Effect of inositol hexaphosphate on the T-R transition. Mizukoshi H. et al. **Biochim Biophys Acta** 1982 Jan 18;700(2):143-7

A kinetic analysis of L-tryptophan transport in human red blood cells. Rosenberg R. **Biochim Biophys Acta** 1981 Dec 7;649(2):262-8

Effect of blue light on the urinary excretion of tryptophan metabolites in adult heterozygous and homozygous Gunn rats. Costa C, et al. **Boll Soc Ital Biol Sper** 1981 Oct 15;57(19):1969-75

Enzyme activities of tryptophan metabolism in heterozygous and homozygous Gunn rats before and after blue light exposure. De Antoni A, et al. **Boll Soc Ital Biol Sper** 1981 Oct 15;57(19):1976-80

Naturally occurring prototrophic strains of Salmonella typhi. Virgilio R, et al. **Can J Microbiol** 1981 Dec;27(12):1272-5

Effect of dl-3-pyridylalanine on serotonin concentration and tryptophan-serotonin metabolizing enzymes in rats. Shimeno H, et al. **Chem Pharm Bull (Tokyo)** 1981 Oct;29(10):2940-8

Stress-modulated alteration of brain biogenic amines in the rat: effects of L-tryptophan. Quirce CM, et al. **Commun Psychopharmacol** 1980;4(5):371-7

The mechanism of tryptophan binding to tryptophan synthase from Escherichia coli. Lane AN, et al. **Eur J Biochem** 1981 Nov;120(2):379-87

Effect of Nin-formylation of the tryptophan residue on gastrin (HG-13) binding and on gastric acid secretion. Magous R, et al. **Eur J Pharmacol** 1982 Jan 8;77(1):11-6

Modification of diazepam's antileptazol activity by endogenous tryptophan-like compounds. Vellucci SV, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):255-9

Construction of new vectors for cloning of promoters. Enger-Valk BE, et al. **Gene** 1981 Dec;15(4):297-305

Increased serotonin level via augmented tryptophan diet and its effect on escape learning. Yehuda S, et al. **Int J Neurosci** 1981;15(4):193-6

Regulation of tryptophan genes in Rhizobium leguminosarum. Holmgren E, et al. **J Bacteriol** 1982 Mar;149(3):1135-7

Effects of long-term low dietary tryptophan intake on determinants of 5-hydroxytryptamine metabolism in the brains of young rats. Ashley DV, et al. **J Neurochem** 1981 Dec;37(6):1385-93

Tryptophan overload in the pregnant rat: effect on brain amino acid levels in in vitro protein synthesis. Fando JL, et al. **J Neurochem** 1981 Oct;37(4):824-9

Simultaneous determination of 3,4-dihydroxyphenylalanine, 5-hydroxytryptophan, dopamine, 4-hydroxy-3-methoxyphenylalanine, norepinephrine, 3,4-dihydroxyphenylacetic acid, homovanillic acid, serotonin, and 5-hydroxyindoleacetic acid in rat cerebrospinal fluid and brain by high-performance liquid chromatography with electrochemical detection. Wagner J, et al. **J Neurochem** 1982 May;38(5):1241-54

The complete nucleotide sequence of the tryptophan operon of Escherichia coli. Yanofsky C, et al. **Nucleic Acids Res** 1981 Dec 21;9(24):6647-68 (62 ref.)

Effect of tryptophan administration on spontaneous and P-CPA-induced muricidal aggression in laboratory rats. Valzelli L, et al. **Pharmacol Res Commun** 1981 Oct;13(9):891-7

Relative contributions of tryptophan and tyrosine to the phosphorescence emission of human serum albumin at low temperatures. Waldmeyer J, et al. **Photochem Photobiol** 1982 Mar;35(3):299-304

Learned aversions in rats fed a tryptophan-free diet. Treneer CM, et al. **Physiol Behav** 1981 Nov;27(5):757-60

[Mutagenicity of the reaction products of L-ascorbic acid and L-tryptophan (author's transl)] Kanamori H, et al. **Yakugaku Zasshi** 1981 Jul;101(7):596-604 (Eng. Abstr.) **(Jpn)**

[Role of tryptophan in the enzymatic activity of histidine decarboxylase from Micrococcus sp. n.] Gonchar NA, et al. **Biokhimiia** 1981 Nov;46(11):1970-80 (Eng. Abstr.) **(Rus)**

[Changes in the functional characteristics of the compound eye of the honeybee after mutations interfering with the metabolism of tryptophan] Gribakin FG, et al. **Neirofiziologiia** 1982;14(1):69-75 (Eng. Abstr.) **(Rus)**

[Changes in the properties of the protein and nucleic acid components of an artificial nucleotide as affected by gamma and UV radiation] Kalabukhova TN, et al. **Radiobiologiia** 1981 Nov-Dec;21(6):912-5 (Eng. Abstr.) **(Rus)**

TRYPTOPHAN HYDROXYLASE

Strain differences in kinetic and thermal stability of two mouse brain tryptophan hydroxylase activities. Knapp S, et al. **Brain Res** 1981 Dec 28;230(1-2):317-36

Purification and properties of tryptophan 5-monooxygenase from rat brain-stem. Nakata H, et al. **Eur J Biochem** 1982 Feb;122(1):41-7

Methamphetamine-induced depression of tryptophan hydroxylase: recovery following acute treatment. Bakhit C, et al. **Eur J Pharmacol** 1981 Dec 3;76(2-3):229-33

Cloning characterization of iaaM, a virulence determinant of Pseudomonas savastanoi. Comai L, et al. **J Bacteriol** 1982 Jan;149(1):40-6

Ontogenesis of monoamine-synthesizing enzyme activities and biopterin levels in rat brain or salivary glands, and the effects of thyroxine administration. Kato T, et al. **J Neurochem** 1982 Apr;38(4):896-901

[Express nonisotope method of determination of tryptophan hydroxylase activity in the brain] Kulikov AV. **Vopr Med Khim** 1982 Jan-Feb;28(1):135-9 **(Rus)**

TYROSINE

Formation of 3H-dopamine and 3H-noradrenaline from 3H-tyrosine in the canine saphenous vein. Boels PJ, et al. **Arch Int Pharmacodyn Ther** 1981 Oct;253(2):315-16

Chemical cleavage of tryptophanyl and tyrosyl peptide bonds via oxidative halogenation mediated by o-iodosobenzoic acid. Fontana A, et al. **Biochemistry** 1981 Nov 24;20(24):6997-7004

Study on the role of tyrosine side-chains at the active centre of emulsin beta-D-glucosidase. Kiss L, et al. **Biochim Biophys Acta** 1981 Dec 15;662(2):308-11

Modification of tyrosine residues in dihydrofolate reductase from Lactobacillus casei. Rosson D, et al. **Biochim Biophys Acta** 1982 Feb 4;701(1):49-56

Assay for plasma free phenylalanine and tyrosine by high-pressure liquid chromatography and field desorption mass spectrometry and its application to an in vivo study of the phenylalanine hydroxylating system in man. Lehmann WD, et al. **Biomed Mass Spectrom** 1981 Dec;8(12):598–605

An ultrastructural and cytochemical analysis of the cellular basis for tyrosine–derived collagen crosslinks in Leptogorgia virgulata (Cnidaria: Gorgonacea). Tidball JG. **Cell Tissue Res** 1982;222(3):635–45

Autoregulation of the tyrR gene. Camakaris H, et al. **J Bacteriol** 1982 Apr;150(1):70–5

Reactions of purified hog thyroid peroxidase with H2O2, tyrosine, and methylmercaptoimidazole (goitrogen) in comparison with bovine lactoperoxidase. Ohtaki S, et al. **J Biol Chem** 1982 Jan 25;257(2):761–6

Chemical modification of D–amino acid oxidase. Amino acid sequence of the tryptic peptides containing tyrosine and lysine residues modified by fluorodinitrobenzene. Swenson RP, et al. **J Biol Chem** 1982 Feb 25;257(4):1937–44

Stimulation of tyrosine–specific phosphorylation by platelet–derived growth factor. Ek B, et al. **Nature** 1982 Feb 4;295(5848):419–20

Relative contributions of tryptophan and tyrosine to the phosphorescence emission of human serum albumin at low temperatures. Waldmeyer J, et al. **Photochem Photobiol** 1982 Mar;35(3):299–304

Reaction of nitrite with tyrosine residues in digestive enzymes. Cheng CC, et al. **Taiwan I Hsueh Hui Tsa Chih** 1981 Nov;80(11):1186–92

[In vitro study of L–tyrosine as a possible substrate for energy metabolism of tissue sections (brain, liver) and its effect on isolated mitochondria of the rat brain] Bonifacj JF, et al. **Agressologie** 1981;22(6):241–4 (Eng. Abstr.) **(Fre)**

TYROSINE AMINOTRANSFERASE

Ontogeny of the glucocorticoid receptor and its relationship to tyrosine aminotransferase induction in cultured foetal hepatocytes. Cake MH, et al. **Biochem J** 1981 Aug 15;198(2):301–7

Enhancement of rat brain tyrosine aminotransferase activity by cortisol. Snape BM, et al. **Biochem J** 1981 Aug 15;198(2):417–20

Growth hormone inhibition of tyrosine aminotransferase in primary cultures of rat liver cells. Shires TK, et al. **Biochim Biophys Acta** 1982 Jan 12;714(1):170–2

Evidence for a dual effect of dibutyryl cyclic AMP on the synthesis of tyrosine aminotransferase in rat liver. Noguchi T, et al. **J Biol Chem** 1982 Mar 10;257(5):2386–90

[Characterization of tyrosine aminotransferase by an immunoadsorption technic. Application to the measurement of the specific messenger RNA] Santana MA, et al. **C R Soc Biol (Paris)** 1981;175(6):859–65 (Eng. Abstr.) **(Fre)**

TYROSINE HYDROXYLASE

Effect of chronic propranolol treatment and withdrawal on norepinephrine and tyrosine hydroxylase in sympathetic tissues. Atkins F, et al. **Arch Int Pharmacodyn Ther** 1981 Dec;254(2):271–81

Retinal amacrine cell system tyrosine hydroxylase: the development of responsiveness to light and neuroleptic drugs. Cohen J, et al. **Brain Res** 1982 Jan;255(1):160–3

The inheritance and genetic correlation of tyrosine hydroxylase activities in the substantia nigra and corpus striatum in the C x B recombinant inbred mouse strains. Vadasz C, et al. **Brain Res** 1982 Feb 18;234(1):1–9

Effect of des–Tyr1–gamma–endorphin and des–Tyr1–alpha–endorphin on alpha–MPT–induced catecholamine disappearance in rat brain nuclei: a dose––response study. Versteeg DH, et al. **Brain Res** 1982 Jan 14;231(2):343–51

Purification and some properties of tyrosine 3–monooxygenase from rat adrenal. Okuno S, et al. **Eur J Biochem** 1982 Feb;122(1):49–55

Ontogenesis of monoamine–synthesizing enzyme activities and biopterin levels in rat brain or salivary glands, and the effects of thyroxine administration. Kato T, et al. **J Neurochem** 1982 Apr;38(4):896–901

Short–term regulation of hydroxylase cofactor activity in rat brain. Mandell AJ, et al. **J Neurochem** 1981 Dec;37(6):1573–8

Tyrosine hydroxylase activity in rat brain synaptosomes: direct measurement using high performance liquid chromatography. Messripour M, et al. **J Neurochem** 1982 Apr;38(4):1139–43

Effect of cyclic AMP–dependent protein phosphorylating conditions on the pH–dependent activity of tyrosine hydroxylase from beef and rat striata. Pollock RJ, et al. **J Neurochem** 1981 Oct;37(4):855–60

Development and aging of noradrenergic cell bodies and axon terminals in the chicken. Yurkewicz L, et al. **J Neurosci Res** 1981;6(5):621–41

Regulation of tyrosine hydroxylase activity in retinal cell suspensions: effects of potassium and 8–bromo cyclic AMP. Iuvone PM, et al. **Life Sci** 1982 Jan 4;30(1):85–91

Tyrosine hydroxylase–like immunoreactive interplexiform cells in the rat retina. Nguyen–Legros J, et al. **Neurosci Lett** 1981 Dec 23;27(3):255–9

Dopaminergic dendrites in the pars reticulata of the rat substantia nigra and their striatal input. Combined immunocytochemical localization of tyrosine hydroxylase and anterograde degeneration. Wassef M, et al. **Neuroscience** 1981;6(11):2125–39

VASOPRESSINS

Vasopressins and other neuropeptides as CNS mental modulators. A review. Edelstein EL. **Isr J Psychiatr Relat Sci** 1981;18(3):229–36

Age–related failure of volume–pressure–mediated vasopressin release. Rowe JW, et al. **J Clin Endocrinol Metab** 1982 Mar;54(3):661–4

Central effects of dopamine and bromocriptine on vasopressin release and blood pressure. Kimura T, et al. **Neuroendocrinology** 1981 Dec;33(6):347–51

VASOTOCIN

Arginine vasotocin: effects on open field behavior, whole brain monoamines and plasma corticosterone. Golus P, et al. **Peptides (Fayetteville)** 1981 Winter;2(4):437–40

[Effect of arginine vasotocin, oxytocin and their fragments on the corticosterone content in the blood plasma of chickens of different ages] Sirotkin AV, et al. **Fiziol Zh SSSR** 1982 Jan;68(1):112–5 (Eng. Abstr.) **(Rus)**

VIOLENCE

The violent girl. Burquest B. **Adolescence** 1981 Winter;16(64):749–64

VISUAL PERCEPTION

Retinal amacrine cell system tyrosine hydroxylase: the development of responsiveness to light and neuroleptic drugs. Cohen J, et al. **Brain Res** 1982 Jan;255(1):160–3

Chlorpromazine reduces the perceptual ambiguity of a reversible visual figure. Harris JP, et al. **Neuropharmacology** 1981 Dec;20(12B):1337–8

Don Juan and the vision of Vision. Smith CU. **Perception** 1981;10(4):435–53

WAKEFULNESS

Effects of oxolinic acid on the sleep–wakefulness cycle of the rat. D'Angelo L, et al. **Br J Pharmacol** 1981 Oct;74(2):399–404

☆U.S. GOVERNMENT PRINTING OFFICE: 1982-379-151/104

The *Psychopharmacology Bulletin* is prepared by the Pharmacologic and Somatic Treatments Research Branch of the National Institute of Mental Health. Its purpose is to facilitate the dissemination and exchange of information among the national and international scientific community. The emphasis is on rapid, informal reporting of work which has not appeared in the more formal literature. We invite contributions such as original articles, brief reports, review articles, letters to the Editor, news items, books for review, and announcements appropriate for the *Bulletin*.

All material published in the *Psychopharmacology Bulletin* is in the public domain unless otherwise noted. Publication in the *Bulletin* therefore does not preclude publication elsewhere.

Individuals interested in submitting material to the *Psychopharmacology Bulletin* should contact:

Allen Raskin, Ph.D.
Editor-in-Chief
Psychopharmacology Bulletin
National Institute of Mental Health
5600 Fishers Lane Rm. 10C-14
Rockville, MD 20857

We respectfully ask you to adhere to the following guidelines when preparing a paper for the *Psychopharmacology Bulletin:*

1. Manuscript Format: Manuscripts should be typed double-spaced with ample margins, and submitted in triplicate. Do not split paragraphs from one page to another, even if this makes page lengths uneven. Also, do not hyphenate words at the end of a line, even if this makes uneven lines.

Title page should include each author's name, degree, and full address.

Papers should be written in *third* person, e.g., the investigators found, *Not*: I found, we found. Contents should be *substantive*, not indicative, e.g., the investigator used the gas chromatography method to determine the three molecular structures, *Not*: The author described the method for determining the structure of the drug.

2. Figures: Figures, charts, or graphs should be submitted as glossies (photographs printed on smooth shiny paper) or should be professionally prepared using black ink on white paper. Only one copy is needed. Indicate in the text where these figures and their legends should be placed.

3. References: References mentioned in the text should appear as full citations in the **References** following the text with *all* authors cited in the reference list, e.g., Simpson, G.M., Lee, L.H., Zubok, B, and Gardos. A rating scale for tardive dyskinesia. *Psychopharmacology (Berlin)*, 64(2):171-179, 1979.

If a work has two authors, always cite both names every time the reference occurs in the text, e.g. (Swanson & Cole 1974). If more than two authors, cite only the surname of the first author in the text followed by et al., e.g., Williams et al. 1963.

4. Abbreviations: Abbreviations should appear in parentheses after the first time they are mentioned in the paper, ie., Brief Psychiatric Rating Scale (BPRS).

Use generic names in referring to drugs; trade names may be given in parenthesis the first time a drug is mentioned only.

Journal titles should be abbreviated in the *References* according to the National Library of Medicine's Index Medicus.

5. Brief Reports: Authors wishing very rapid reporting of new work may submit manuscripts of up to five typed double-spaced pages for inclusion as Brief Reports. If accepted, these results would appear in the next issue of the *Bulletin*. In preparing a manuscript for publication as a Brief Report, please follow the format cited above.
